Our strong northern European market position

● **Home markets** – we serve customers with a wide range of products in Sweden, Norway, Denmark, Finland, Estonia, Latvia, Lithuania, Germany and the United Kingdom.

Switzerland, Austria and the Netherlands are defined as home markets with a selective approach.

Furthermore, we support our home market customers around the world from Beijing, Shanghai, Hong Kong, Singapore, New Delhi, São Paulo, New York, to Luxembourg, Nice, Kyiv and Warsaw.

Our divisions from 1 January 2025

Corporate & Investment Banking

Commercial and investment banking services for large corporate and institutional customers.

Business & Retail Banking

Full banking and advisory services to private individuals and small and medium-sized corporate customers in Sweden as well as corporate payment services in Europe.

Wealth & Asset Management

Comprehensive product and service offering within the areas of Private Wealth Management & Family Office, Asset Management and Life.

Baltic

Full banking and advisory services for private individuals and corporate customers in the Baltic countries.

About this report

SEB is committed to maintain public transparency with regards to the development of its business, financial performance and risks. Extensive information is provided in the group's financial reports, including the Annual Report, the quarterly interim reports and in the Fact Books. In the Pillar 3 disclosures, SEB provides additional information on its risk exposures, risk management and capital adequacy.

Regulatory framework for disclosures

The Basel Committee's framework for banking regulation is based on a concept of three pillars:

Pillar 1 – Minimum capital requirements to meet credit, market and operational risk;

Pillar 2 – Supervisory review process, and the bank's internal process for assessing overall capital and liquidity adequacy in accordance with its risks; and

Pillar 3 – Market discipline enabled by disclosures.

Pillar 3 entails extended disclosures by banks with regard to their capital position, risk exposures and risk management processes. Pillar 3 requires all material risks to be disclosed in order for investors and other market participants to assess the risk profile of individual banks. The disclosure requirements are stipulated in the *Capital Requirements Regulation* (CRR) and in the *Capital Requirements Directive* (CRD). Additional CRR requirements entered into force on 27 June 2019, while amendments to the CRD, after transposition to Swedish law, started to apply on 29 December 2020. The majority of the supplementary CRR requirements entered into force on 28 June 2021.

Basis for SEB's Pillar 3 disclosures

SEB's Pillar 3 disclosures are prepared in accordance with the requirements stipulated in the Capital Requirements Regulation (Regulation (EU) 575/2013), the EBA's implementing technical

standards (ITS) with regard to disclosure of own funds (EU Regulation No 1423/2013), the Swedish FSA's regulations on prudential requirements and capital buffers (FFFS 2014:12) and the EBA's guidelines on disclosure requirements under Part 8 of the CRR. Together with the Annual Report, this report and the additional quarterly and semi-annual Pillar 3 disclosures provide information on SEB's material risks, including details on the group's risk profile forming the basis for the calculation of the capital requirement. The Pillar 3 disclosures complement the Annual Report with additional information and is therefore intended to be read in conjunction with the Annual Report. In particular the sections on "Corporate Governance" and the Notes to the financial statements.

The Pillar 3 report 2024 is based on the group consolidated situation as at 31 December 2024. The group consolidated situation represents the regulatory scope of consolidation according to the CRR, established for the purposes of prudential supervision and differs from the group's consolidated financial statements as set out in the Annual Report.

The relationship between the group consolidated situation and the group consolidated financial statements is set out in Tables 63–65 in this report.

The group consolidated situation is based upon its financial position established by the accounting policies of the group, in accordance with Inter-

national Financial Reporting Standards (IFRS) and interpretations of those standards as adopted by the European Commission. In this report, SEB consolidated situation is referred to as SEB, unless otherwise stated.

The significant accounting policies for the group are presented in the Annual Report, note 1 Accounting Policies. The information in this report has not been subject to external audit. The Pillar 3 disclosures can be found on SEB's website www.sebgroup.com.

This report is produced in accordance with the group's disclosure policy and internal processes, systems and controls for financial and regulatory reporting.

1) Averages of month end observations over the twelve months preceding the end of each quarter.

Overview of SEB's risk development

Managing risk is an integral part of banking, and risk awareness is deeply embedded in SEB's corporate culture. The bank has a comprehensive framework for risk, liquidity, and capital management to ensure regulatory compliance and safeguard the bank's financial position. The framework is continuously developed to reflect current market trends, new regulations as well as to detect emerging risks.

Navigating uncertainty with focus on resilience

The year of 2024 unfolded against a backdrop of accelerating geopolitical risks and economic uncertainty. The overall impact on SEB from external events has been limited, however, and SEB's risk profile remained stable with low credit losses and a strong capital and liquidity position.

Credit demand was subdued throughout the year with growth in the credit portfolio primarily driven by currency effects in the corporate portfolio and SEB Kort's acquisition of AirPlus. An exception to the generally muted growth was the Baltic credit portfolio which recorded a steady growth with strong and stable asset quality.

There was no clear deterioration in any particular sector, although there were a few company specific challenges and lingering effects of the higher interest rates visible across sectors. We have remained close to our real estate customers throughout the past years as the sector has been challenged by high financing costs. In 2024, the sector saw some respite with falling interest rates and improved financing conditions. Overall, both corporates and households remained resilient.

SEB has robust processes in place to identify and monitor vulnerable customers with an elevated risk of loss at an early stage. In addition, sector specific portfolio reviews are conducted on a recurring and ad hoc basis for sectors facing increased risks to identify early warning indicators

and enable proactive measures. In 2024, SEB updated its strategy for internal credit risk models on the back of the ECB's review of internal models used by European banks. Changes to some credit risk models are under way and more updates are expected in coming years. Our assessment is that on overall SEB level the impact will be small.

Market risk, measured as Value-at-Risk, declined during 2024 due to more cautious risk-taking and lower overall market volatility, with the temporary exception of the market turbulence of 5 August. The impact on SEB from this turbulence was insignificant.

The geopolitical development continued to drive

risks in all risk type areas, although most notable in non-financial risks, with an increasing number of cyber-attacks targeting companies and financial institutions. The impact on SEB has been limited, and the bank continued the work to strengthen capabilities within the area of digital operational resilience during the year. In addition, the bank continued to prepare for the implementation of new regulation that sets out specific requirements for ensuring digital resilience.

Another growing challenge is financial crime, including fraud, with both volume and complexity of methods used on the rise. During the year, SEB implemented enhanced governance and controls

to manage both internal and external fraud.

Moreover, climate change and sustainability-related risks remain high on the agenda, and in 2025, a focus area will be preparation for the upcoming new EBA ESG Guidelines.

The total Risk Exposure Amount (REA) increased, mainly due to higher credit risk REA driven by currency movements as well as the integration of AirPlus. The REA development contributed to 110bps of the 150bps decline in the CET1 ratio in 2024.

In today's dynamic environment, with constantly evolving regulatory and stakeholder expectations, we are continuously overseeing and enhancing our

Development of risk exposure amount (REA)¹⁾

SEK bn

Risk exposure amount (REA)¹⁾ 2024 development

SEK bn

1) REA measures banks' risk-taking and is a basis for the banks' capital requirement.

governance and risk management practices. With rising uncertainties, elevated geopolitical tensions, and a challenging macroeconomic landscape, 2024 underscored the need for resilience and adaptability.

Robust asset quality and muted credit portfolio growth

SEB's credit portfolio includes loans, contingent liabilities and derivatives. The portfolio is well-balanced and diversified and is mainly comprised of Nordic and German large corporates and Swedish households. In 2024, overall credit demand remained subdued. SEB's total credit portfolio increased to SEK 3,160bn (3,040), primarily explained by currency effects and a slight uptick in corporate lending.

The underlying asset quality remained robust, with net expected credit losses at low levels. Early warning indicators such as late payments, bankruptcy statistics and negative risk class migration, presented a somewhat mixed picture. While the number of bankruptcies in Sweden increased, the proportion of SEB clients affected remained limited, and late payments among SEB clients continued to decline. However, the negative trend in risk class migration observed in 2023 persisted although it was not confined to any particular sector, confirming a more broad-based pattern following the broader macroeconomic development, and delayed impact from the higher interest rate environment. SEB's large share of exposure to investment grade counterparties acts as a safeguard against considerable impact on credit losses and capital.

Net expected credit losses (ECL) amounted to SEK 886m (962), corresponding to a net ECL level of 3 basis points (3). Credit-impaired loans (gross loans in Stage 3) amounted to SEK 10.1bn at year-end (7.6), corresponding to 0.47 per cent of gross lending (0.37). The Stage 3 ECL coverage ratio

decreased during the year from 40 per cent to 32 per cent. This decline was attributed to an influx of secured and/or state guaranteed exposures, along with an increase in financial guarantees and commitments which has a lower ECL coverage ratio than loans. Overall, SEB holds total ECL allowances of SEK 7.4bn (8.0), of which total portfolio overlays amounted to SEK 1.2bn (2.3).

Robust corporate credit portfolio

The majority of SEB's credit portfolio consists of exposure to corporates. These are primarily large investment grade customers in the Nordics and Germany in a wide range of industries, of which the largest is manufacturing. In total, the corporate portfolio increased to SEK 1,751bn (1,675) in 2024, mainly driven by currency effects. SEB Kort's acquisition of AirPlus contributed with an increase in credit exposure of SEK 13bn. SEB's exposure to small and medium-sized enterprises (SMEs) outside the Baltic countries accounted for 12 per cent (12) of the corporate portfolio and is

mainly in Sweden. In total, the SME portfolio grew to SEK 212bn (194) during the year.

Stable Swedish household mortgage portfolio

In 2024 the Swedish housing market benefited from a declining interest rate environment that provided some relief to households. Transaction volumes started to pick up after a couple of slow years, signaling renewed confidence in the market, and price levels increased modestly. SEB's Swedish household mortgage portfolio increased to SEK 588bn (580). The modest development was partly explained by continued high competition and customers amortising on their loans at a higher pace than required. Over 75 per cent of the portfolio had floating interest rates at the end of the year, compared to 50 per cent before the interest rate hikes began in 2022. Asset quality in the portfolio remained high and credit losses were low. Late payments remained stable at low levels, although still somewhat elevated compared to the levels

prior to the interest rate hikes.

Credit decisions are based on the borrower's repayment capacity, including the ability to manage a stressed scenario with higher interest rates. If a mortgage is related to an apartment in a housing cooperative association, a common form of multi-family home ownership in Sweden, the stressed scenario takes into account the borrower's share of the association's debt. The portfolio loan to value (LTV) ratio remained sound with a portfolio weighted average LTV of 55 per cent (57). 97 per cent of the portfolio with an LTV above 70 per cent is amortising.

Resilient real estate portfolio with optimism returning to the sector

SEB's exposure to the real estate sector includes commercial and residential real estate and Swedish housing cooperative associations. In 2024, the credit portfolio decreased to SEK 426bn (430), in a continued subdued transaction market.

SEB's credit exposure to commercial real estate

Credit portfolio, development by sector

SEK bn

management companies increased to SEK 219bn (216). The portfolio consists mainly of large customers in the Nordic region with diversified property portfolios. The weighted average LTV remained stable at 47 per cent (47).

The bank's credit exposure to residential real estate management is primarily concentrated in Sweden and encompasses high-quality private and publicly owned real estate companies, along with institutional investors. Demand for residential real estate in Sweden is typically stable and non-cyclical due to the low vacancy risk and regulated rental market. At year end, the residential real estate portfolio amounted to SEK 142bn (148). Weighted average LTV for the portfolio was 46 per cent (45).

The bank also has SEK 65bn (66) in credit exposure to housing cooperative associations.

SEB manages its exposure to the real estate sector through divisional volume growth limits set on an annual basis as well as a group-wide risk

appetite for the commercial real estate exposure that it should not exceed 10 per cent of the total non-bank credit portfolio. The conservative real estate credit policy focuses on measures related to debt service capacity. Credit approval standards are regularly reviewed and updated to reflect the risk level in the real estate market.

After a few years of being strained by surging inflation and subsequent interest rate hikes, the Swedish real estate sector saw some respite in 2024 with falling interest rates and improved financing conditions both in the bond- and bank markets. As a result, key ratios, including property values and cash flows, are expected to gradually improve. The transaction market activity is also expected to pick up. However, the risk of a prolonged economic recession and the global trend of rising office and retail vacancy rates due to the hybrid work model following the covid-19 pandemic, remain concerns. SEB will continue to carefully monitor the development, although SEB's exposure to the segment is primarily in central areas with lower vacancies.

Asset quality in SEB's real estate portfolio remained robust in 2024 with low levels of credit losses. Despite some continued negative risk class migration following the period with higher financial pressure, the portfolio remained resilient, supported by good operational performance, low vacancies and consumer price indexed rents. On the back of the improvements in the operating environment and macroeconomic outlook, SEB reduced portfolio model overlays for the real estate sector during the year.

Stable Baltic credit portfolio

SEB's Baltic credit portfolio amounted to SEK 261bn (239) at year-end, corresponding to 8.7 per cent of the total non-bank credit portfolio. The portfolio has grown steadily over the past

years, and the composition is largely centred around corporate and household mortgage exposures. In 2024, growth was primarily driven by these segments, along with currency effects. While declining inflation and interest rates provided some relief for both corporates and households, they remained elevated, and the geopolitical environment continued to present uncertainty. Asset quality remained robust and net expected credit losses were low. The negative trend in risk class migration observed in 2023 continued in 2024, although a slight improvement was noted towards the end of the year. Overall, corporate and household mortgage clients have managed geopolitical impacts and the higher cost environment well.

Inflation and trade policy major drivers of market risk

In 2024, market developments continued to be influenced by macroeconomic factors, particularly central bank interest rate policies addressing inflation in the fixed income and equity markets. The SEK also continued to weaken against both EUR and USD throughout the year, on a mix of expectations regarding economic development and interest rate policy. In the second half of the year, the US election and the resulting shifts in market sentiment regarding U.S. policies, had significant effects across many global markets. On the back of market developments and in particular for fixed income markets, SEB's overall market risk exposure was reduced compared to 2023. The annual average trading VaR decreased to SEK 139m (247), reflecting the lower market volatility and the reduced risk exposure.

Stable risks in the life insurance business

SEB's insurance business consists mainly of unit-linked products, where the market risk remains with the customer. In 2024, unit-linked products

Credit portfolio, distribution by geography¹⁾ Per cent

1) Distribution based on SEB's operations.

accounted for 89 per cent of total premium income (69). In addition to unit-linked products, SEB also offers risk insurance products in Sweden and the Baltics, portfolio bond type products in Ireland and traditional life insurance in Sweden. Capitalisation levels under Solvency II requirements across all companies in the Life division remained strong and stable.

The traditional life insurance portfolios expose SEB to market risk due to the guaranteed elements of the products. However, the difference between the value of the assets and the guaranteed commitments serves as a buffer against earnings volatility. During 2024, this buffer increased slightly mainly due to higher return.

The share of alternative investments in the traditional insurance investment portfolios decreased somewhat but remained at an elevated level of around 49 per cent. Alternative investments generally increase the overall risk level in a portfolio, as valuation, market, liquidity and non-financial risks are deemed higher relative to traditional investment asset classes. These risks are primarily mitigated by a high level of diversification within the asset class as well as a strong governance and valuation process.

Continued high focus on operational resilience

Net operational losses from incidents remained low at SEK 358m (154) in 2024. The management of non-financial risks, and operational resilience in particular, remained high on the agenda as the banking sector navigated the geopolitical risk development, evolving regulatory requirements, and technological advancement.

Cyber threats and dependency on third-party relationships are key risks in the area of operational resilience as a cyber-attack or physical damage to infrastructure targeting SEB or one of our third parties could lead to operational disruptions, information and data breaches, and reputational damage. During 2024, the work to strengthen the bank's cyber and third-party management continued and included preparations for the Digital Operational Resilience Act (DORA) which applies from January 2025. DORA aims to strengthen the financial sector's digital operational resilience by setting requirements on, among other, Information and Communication Technology (ICT) risk management, ICT third-party risk management and cyber threat information sharing. The industry-wide focus on and investments in operational resilience to comply with DORA will have benefits for SEB, both directly through our own efforts, and indirectly as our counterparties and suppliers are also held to higher standards.

The Swedish government is also proactively upgrading the country's total defense, and the banking sector plays a major role in that work. All Swedish banks have been commissioned by the Swedish Financial Supervisory Authority and the Swedish Central Bank to map operations in the event of heightened alert or war and remedy any identified shortcomings in order to ensure the ability to deliver critical services. During 2024, SEB established a Civil Defence function dedicated to working with these issues.

Fraud remains a challenge for the bank as well as society as a whole. The rapidly increasing number of fraud cases and the increasing complexity of methods used exposes SEB to reputational risk and financial losses. During the year, several security measures were taken by SEB, other banks and authorities to make it more difficult for criminals to exploit the financial system.

Financial Crime, including money laundering, terrorist financing and sanctions evasion, continues to present challenges primarily driven by the geopolitical risk landscape, global economic uncertainty and organised crime. Processes and controls have been improved over the past years, but continuous enhancements are required to ensure that regulatory obligations are met and prevent increasingly sophisticated schemes.

To limit exposure to non-financial risk, SEB has implemented an effective internal control framework that ensures a structured and consistent usage of non-financial risk mitigating tools and processes. The framework is continuously developed and improved to reflect developments in the risk environment.

Liquidity management

A well-balanced liquidity and funding strategy

SEB benefits from a strong liquidity position and maintains a diversified and stable funding base of deposits and wholesale funding.

SEB has a diversified deposit base in terms of customer segments, currencies and markets. Through the bank's long-term relationship model, corporate deposits have proven stable over time. In 2024, the deposit balance remained stable with a slight increase mainly in non-financial corporates. The loan-to-deposit ratio, excluding repos and collateral margins, decreased slightly to 118 per cent per year end (121).

In 2024, central banks started to cut policy rates following lower inflation, and credit spreads moved lower compared to 2023. SEB's funding activity returned to more normalised levels compared to the elevated levels in 2023, which was marked by quantitative tightening and event risk. An equivalent of SEK 116bn (197) of long-term funding was issued during the year, of which SEK 68bn was in the form of covered bonds, SEK 19bn in senior unsecured debt, SEK 14bn senior non-preferred debt and SEK 16bn in subordinated debt. The subordinated issuance included two Additional Tier 1 capital notes of USD 500m and SEK 5bn, and a EUR 500m Tier 2 capital note. In addition, SEB issued a senior non-preferred bond of EUR 500m in green format, bringing the total amount of outstanding green issues to EUR 4bn.

At year-end, total long-term funding amounted to SEK 598bn (564) and short-term funding in the form of commercial paper and certificates of deposit amounted to SEK 349bn (337).

SEB manages its assets and liabilities in line with the Net Stable Funding Ratio (NSFR) regulatory requirement, to ensure that the bank's illiquid long-term assets are financed using a sufficient level of

stable long-term funding. At year-end, SEB's NSFR was 111 per cent (112), compliant with both the minimum regulatory requirement and the Board's risk appetite for a sound structural liquidity risk position.

The Liquidity Coverage Ratio (LCR) measures to what extent SEB's liquid assets are sufficient to cover short-term cash outflows in a stressed scenario. At the end of 2024, SEB's LCR was 160 per cent (140), in compliance with the minimum requirement of 100 per cent. SEB also met both internal and external requirements on the minimum LCR requirement for individual currencies, including EUR, USD, and other significant currencies.

At the end of 2024, SEB's weighted High Quality Liquid Assets (HQLA) amounted to SEK 673 bn (739). The size and composition of liquid assets are continuously assessed against estimated liquidity needs.

Our standing in the credit market is highly important for SEB. Having access to cost efficient funding benefits all our stakeholders. SEB has a strong credit rating of AA-/Aa3/A+ by Fitch, Moody's and S&P, respectively. Moody's and S&P changed their outlook from stable to positive during the year, while Fitch maintained its stable outlook.

Risk management

SEB takes risk with the aim of creating customer value and sustainable returns to shareholders. Management of risk is a core activity in a bank and fundamental to long-term profitability and stability.

Risk management framework

SEB defines risk as the possibility of a negative deviation from an expected financial outcome. Risk-taking and risk management are integral parts of all SEB's business activities and shall therefore be inter-linked with the business strategy. SEB's profitability and viability are directly dependent on its ability to evaluate, manage and price the risks encountered, while maintaining an adequate capital and liquidity position to meet unforeseen events.

SEB's main risk is credit risk. Other risks include market risk, operational risk, liquidity risk, insurance risk, pension risk, business risk, strategic risk and reputational risk. Sustainability related risks are not regarded as a separate risk category, but as risk factors that have bearing on the existing risk categories. This means that the management of sustainability-related risks is integrated into the existing governance and processes for identifying, measuring, assessing, monitoring, managing, mitigating, reporting and pricing risks.

SEB has a robust risk management framework, with defined Board risk appetite, independent risk control, risk analysis and credit approval functions supported by advanced internal risk measurement models. The cornerstones of SEB's risk and capital management include Board supervision, common definitions and principles, a clear decision-making structure, controlled risk-taking within established limits, a high level of risk awareness among staff, and a high degree of transparency in external dis-

closure. SEB's risk culture is based on long experience, strong customer relationships and sound banking principles providing a solid foundation for the bank's risk governance.

Risk appetite

The Board of Directors is responsible for deciding on the Risk Appetite. The Risk Appetite consists of risk appetite statements that articulate in written form the long-term aggregate level and types of risk SEB is willing to assume to achieve its strategic objectives, and risk appetite measures that quantify the statements and set out the levels of risk tolerated by the Board. Risk Appetite measures are established for the group and cascaded to the divisions and the business areas through limits, key risk indicators, portfolio caps etc. The Risk Appetite is reviewed in connection with the annual approval of SEB's Business Plan and apply to the entire group.

SEB's risk profile, in relation to the risk appetite, is monitored and followed up regularly by the risk organisation and is reported on a quarterly basis to the *Group Executive Committee* (GEC), the *Group Risk Committee* (GRC), the *Board's Risk and Capital Committee* (RCC) and the Board.

Three lines of defence

As the first line of defence, the business units are responsible for the risks that arise as a result of their business activities. Long-term customer relationships and a sound risk culture provide a solid foundation for SEB's risk-taking decisions. Initial

risk assessments are made of both the customer relationship and the proposed transaction. The business units ensure that transactions are correctly priced and that the assumed risks are managed throughout the life of the transaction. Larger transactions are approved by the bank's credit committees.

The business units are responsible for ensuring that their activities comply with applicable external and internal rules. They are supported by policies and instructions, and a clear decision-making structure.

The risk and compliance functions constitute the second line of defence and are independent from the business. The risk function is responsible for ensuring that risks are identified, measured, assessed, monitored, managed, mitigated and reported in SEB. Risks are managed both on an aggregated level as well as on a detailed divisional and geographical level. SEB has developed advanced internal measurement models for a major part of its credit portfolio, as well as for market and operational risk, and has approval from the Swedish FSA and the ECB to use these models for calculation of regulatory capital. Risks are monitored and controlled through limits on transactional, counterparty, desk and portfolio levels. Asset quality is monitored and analysed regularly, for example through stress testing.

The compliance function ensures the quality of compliance and focuses on issues such as customer protection, conduct in the financial market,

Risk Appetite statements in brief

SEB shall:

Maintain a high-quality credit portfolio through a robust credit culture based on long-term relationships, knowledge about customers and focus on debt service ability

Maintain a sound structural liquidity position, a balanced wholesale funding dependence and sufficient liquid reserves to meet potential net cash outflows in a stressed scenario

Limit the bank's exposure to non-financial risk through an effective internal control framework and by ensuring a structured and consistent usage of risk mitigating tools and processes for all identified material non-financial risks

Limit the impact of adverse developments in economic value and earnings from market risk, including valuation uncertainty, from both a short- and long-term perspective

Maintain satisfactory capital strength to manage aggregated risks, guarantee SEB's long-term survival, operate safely above regulatory minimum levels, and support rating targets and the bank's position as financial counterparty.

prevention of money laundering and financing of terrorism, and other regulatory compliance and control, under the direction of the Board and management.

Internal Audit is the third line of defence, and

reviews and evaluates that SEB's risk and compliance management is adequate and effective both in the first and second line of defence. The internal auditors are in turn evaluated by external auditors. Based on the evaluations by the third line, the processes in the first and second lines of defence are continuously strengthened. SEB's robust governance framework, in combination with its sound risk culture and business acumen, constitutes the cornerstones of an effective risk management.

Risk governance

SEB's risk governance is structured as follows.

The *Board of Directors* shall ensure that SEB is organised in such a way that, among other things, it has an effective internal control framework ensuring that all risks inherent in the activities of the group are identified, measured, assessed, monitored, managed, mitigated and reported, and that the functions for risk control, compliance and internal audit are in place, that they are independent, separate from each other and have adequate resources, competences and responsibilities. The Board defines the principles for risk management in SEB's Group Risk Policy. This policy is supplemented by instructions issued by the *Risk and Capital Committee* and the *Group Risk Committee*. The Board defines the bank's overall risk appetite, and risk mandates are allocated by board committees and executive management committees. A comprehensive risk management governance structure ensures that policies approved by the Board are effectively complied with in all of SEB's risk-taking activities.

The *Risk and Capital Committee* (RCC) supports the Board in ensuring that SEB is organised and managed in such a way that all risks inherent in the group's business are controlled in accordance with the Board's Risk Appetite as well as with external

and internal rules. The RCC also monitors the group's capital situation on a regular basis. The RCC sets the principles and parameters for measuring and allocating risk and capital within the group and oversees risk management systems and the risk appetite and strategy for the near and long-term.

The RCC prepares a recommendation for the appointment and dismissal of the *Chief Risk Officer* (CRO). Furthermore, the committee decides on individual credit matters of major importance or of importance as to principles and assists the Board's Remuneration Committee in providing a risk-based view on the remuneration system. The group's *Chief Financial Officer* (CFO) has the overall responsibility for informing and submitting proposals to the RCC on matters related to capital and funding. The CRO has the same overall responsibility regarding risk and credit related matters. The CEO, the CFO and the CRO regularly participate in the meetings.

The *Group Risk Committee* (GRC) is a group-wide, decision-making committee that addresses all types of risk at group level in order to evaluate portfolios, products and customers from a comprehensive risk perspective. The GRC is tasked with making important credit decisions and ensuring that all risks inherent in the group's activities are identified, measured, assessed, monitored, managed, mitigated and reported in accordance with internal and external rules. The GRC also supports the CEO in ensuring that decisions regarding the group's long-term risk appetite are followed in the business organisation and ensures that the Board's guidelines for risk management are implemented and that the necessary rules and policies for risk taking in the group are maintained and enforced. The committee's chairman is the CEO and the deputy chair is the CRO.

The *Asset and Liability Committee* (ALCO) is a

groupwide decision-making, monitoring and consultative body that manages financial stability, particularly in new regulatory frameworks, strategic capital and liquidity issues (including internal capital allocation and principles for internal pricing), balance sheet structure and development and other balance sheet related issues, financing of wholly owned subsidiaries, as well as the group's funding strategy. The committee's chairman is the CEO and the deputy chair is the CFO.

The *Group Internal Control and Compliance Committee* (GICC) is a committee that shall address and follow-up on reports from the control functions Group Internal Audit, Group Compliance, and where relevant the Chief Risk Officer function, as well as reporting and escalations from the Group FCP Committee and the Group Data Privacy Committee. The committee's chairman is the CEO and the deputy chair is the deputy CEO. The CRO is appointed by the Board and reports to the CEO. The CRO regularly informs the Board, the RCC, the ACC, the GEC, the ALCO and the GRC regarding risk matters. The CRO has a global functional responsibility, and the activities of the CRO are governed by and set out in an instruction adopted by the Board. The CRO Function is organised in units for each risk type and Group Credits.

The units for Enterprise, Market, Credit, Liquidity, Non-Financial and Model Risk are responsible for ensuring that risks are identified, measured, assessed, monitored, managed, mitigated and reported in SEB. The units also develop and maintains SEB's risk measurement models and are overall responsible for the risk management framework within their area of responsibility. In addition to this the unit for Enterprise Risk aggregates and analyses data across risk types and handles general matters surrounding risk governance and risk disclosure. The main objectives and the

responsibilities are outlined in instructions for each separate risk type.

Group Credits review and oversee the composition of the credit portfolio and monitor the adherence to credit policies and instructions. The unit provides appropriate checks and balances in the credit decision-making process by ensuring that credit origination decisions made by the Divisions are subject to an independent second opinion to the extent justified by their size and complexity. Group Credits is also, through its officers, mandated to challenge or veto credit origination decisions as set forth in the Credit Instruction. The main objectives and responsibilities are outlined by the Instruction for Group Credits.

→ For further information about SEB's governance arrangements, please see the Annual Report – Corporate Governance. This section also provides information on the number of directorships held by Board members, the recruitment and diversity policies for the selection of Board members, as well as more information on the work of the RCC.

Credit risk

Credit risk is the risk of loss due to the failure of an obligor to fulfil its obligations towards SEB. The credit risk concept also comprises counterparty credit risk derived from trading activities, country risk, settlement risk and credit concentration risk.

Risk management

The predominant risk in SEB is credit risk which arises from lending activities and through commitments to customers, including large companies, small and medium-sized companies, financial institutions, public sector entities and private individuals.

SEB's credit portfolio includes loans, contingent liabilities and trading products and is well-balanced with a stable risk profile. The main focus is on corporate customers in the Nordics, Germany, UK and the Baltics and households in Sweden and the Baltics.

More than half of the credit portfolio consists of exposure to corporates, primarily Nordic and German large corporates active in a wide range of industries and geographies. The household portfolio, accounting for 24 per cent (25) of the total credit portfolio, is dominated by Swedish household mortgages. This portfolio is of high quality with low and stable historical credit losses, a sound portfolio loan-to-value ratio and proven strong repayment capacity among customers. Exposure to real estate management accounts for 14 per cent (14) of the total credit portfolio and is comprised of residential real estate and housing co-operative associations in Sweden and commercial real estate in the Nordic region. Of the total credit portfolio, the Baltic countries account for 8 per cent (8).

Credit policies and approval process

The main principle in SEB's general credit policy is

that all lending is based on credit analysis and is proportionate to the customer's cash flow and ability to repay. The customer must be known by the bank and the purpose of the loan shall be fully understood. The business units take full responsibility for the credit risk until repayment.

A credit approval is based on an evaluation of the customer's creditworthiness and the type of credit. Relevant factors include the customer's business and financial risk factors (current and anticipated), monitoring capacity by way of covenants and protection provided by collateral. The credit decision also includes a separate and independently assigned risk classification of the customer based on this analysis, as well as an assessment of transaction specific characteristics. The process differs depending on the type of customer (for example retail, corporate or institutional), risk level, as well as the size and type of transaction.

For larger corporate and institutional customers, autonomous and professional credit analysis is particularly important, and the credit decisions supported by the business areas are independently verified by a minimum of two credit officers. For private individuals and small businesses, the credit approval process is often based on credit scoring models. All credit decisions of significance require the support of the chair of a credit committee who is independent from the business.

Credit decision-making is based on a hierarchical structure, with the *Group Risk Committee* (GRC) being the highest credit granting body, with limited

exceptions. Below the GRC are divisional credit committees, and, in turn, local credit committees depending on the location of the customer, with small approval authorities for certain bank officers. The approval mandates for each level are set on a risk-adjusted basis using both quantitative and qualitative criteria.

Managing sustainability risks in the credit portfolio

In SEB's counterparty credit analysis, the group assesses the impact that environmental, social and governance (ESG) drivers might have on the customer's repayment capacity. According to SEB's general credit policy, all lending should be in line with the Corporate Sustainability Policy for the SEB Group with supplemental policies, as well as with relevant position statements and sector policies.

→ For further information regarding SEB's management of sustainability risks in its credit portfolio, in particular climate risks, please see the ESG section in this report and in the Sustainability statement in the Annual Report.

Limits and monitoring

To manage the credit risk for each individual customer or customer group, a limit is established, reflecting the maximum exposure that SEB is willing to accept on the customer. Limits are also established for total exposure in geographies with higher risk classes, certain customer segments and for settlement risks in trading operations.

SEB continuously reviews the quality of its credit exposures. All total limits and risk classes are reviewed at least annually by a credit approval body as authorised by the group's Credit Instruction, adopted by the Board. Weak or impaired exposures (risk classes 13–16) are subject to more frequent reviews, including analysis of performance, outlook and debt service capacity. The objective is to identify and follow-up, at an early stage, credit exposures with an elevated risk of loss to SEB, and to work together with the customer towards a constructive solution that enables the customer to meet its financial obligations and SEB to reduce or limit credit losses. In its core markets, SEB maintains local restructuring teams that are engaged in problem exposures. These are supported by a restructuring function on group level which assist and advice the client teams in managing problem exposures.

Allowances are made for expected credit losses of financial instruments in scope for impairment measured at amortised costs according to the accounting standard IFRS9 Financial Instruments. The guiding principle of the expected credit loss model is to reflect the general pattern of deterioration or improvement in the credit quality of the financial instruments.

→ For a description of the methodology and assumptions made to estimate the expected credit losses, please see note 1 and note 17 in the Annual Report.

Loans where the contractual terms have been amended in favour of the customer due to the customer's financial difficulties are referred to as forbearance loans. Forbearance measures range from amortisation holidays (the most common measure) to refinancing with new terms and debt forgiveness. Both forbearance measures and the classification of the loan as being forbearance require approval by the relevant credit approval body.

Credit portfolio analysis and stress tests

The risk organisation regularly reviews and assesses the aggregated credit portfolio and its asset quality based on industry, geography, risk class, product type, size and other parameters.

Thorough analyses are made on risk concentrations in geographic and industry sectors as well as towards large customers, both in respect of direct and indirect exposures and in the form of collateral, guarantees and credit derivative protection.

The analysis of the credit risk profile is presented on a quarterly basis to the GRC, the RCC and to the Board of Directors.

Stress tests of the credit portfolio, including reverse stress tests, are performed regularly as a part of SEB's annual internal capital adequacy assessment process (ICAAP). Specific analyses and stress tests of certain sectors or sub-portfolios are performed as required. These portfolio reviews are presented to the GRC and to the Board's RCC.

COMMENT

- The total exposure decreased due to a decrease in cash balances at central banks and other demand deposits. Non-performing exposures increased to SEK 15.6bn (11.6) and credit-impaired loans (gross loans in stage 3) increased to 0.47 of total loans (0.33). The asset quality of the credit portfolio remained robust. Negative risk migration continued but in 2024 there were more risk class upgrades than downgrades.
- Total ECL allowances amounted to SEK 7.4bn (7.7) and the ECL coverage ratio was 0.24 per cent (0.27).

Table 3. EU CR1-A – Maturity of exposures

COMMENT

- 51 per cent of the loans and advances has a maturity below five years, mainly due to corporate exposures. Compared to 30 June 2024, this has not changed materially.

COMMENT

- Forborne credit exposures are exposures where the contractual terms have been amended in favour of the customer due to financial difficulties. Forbearance measures range from amortisation holidays (the most common measure) to refinancing with new terms and debt forgiveness.
- Total forborne exposures increased to SEK 13.2bn (11.6). Non-performing forborne exposures increased to SEK 6.4bn (5.6) due to negative risk migrations which were partly offset by write offs.

COMMENT

- Non-performing exposures increased to SEK 15.6bn (10.6) mainly due to negative risk migrations in the large corporate segment which was partly offset by write-offs. Currency translation effects increased non-performing exposures due to the strengthening of the EUR and USD towards the SEK.

COMMENT

- The NPL ratio in SEB is below 5 per cent. According to the CRR, the columns “of which non-performing” and “of which subject to impairment” in EU CQ4 are applicable to institutions with a threshold ratio on non-performing loans and advances (NPL ratio) of 5 per cent or above.
- Gross carrying amount/nominal amount for defaulted loans increased to SEK 14.4bn (10.1) due to negative risk migrations which were partly offset by write offs.

080	TOTAL		1		1

COMMENT

- The collateral obtained by taking possession remained low.

Credit risk mitigation and collateral

Depending on the creditworthiness of the customer, as well as the nature and complexity of the transaction, collateral and netting agreements can be used to a varying extent to mitigate the credit risk. In the selection of a particular credit risk mitigation technique, consideration is given to its suitability for the product and customer in question, its legal enforceability, paired with SEB's experience and capacity to manage and control the particular technique. The most important credit risk mitigation techniques are collateral pledges, guarantees and netting agreements. The most common types of pledges are real estate, floating charges and financial securities.

For large corporate customers, credit risk is often monitored and mitigated through the use of restrictive covenants in the credit agreements, including negative pledges. Autonomous and professional credit analysis is particularly important for this customer segment.

Banks, securities firms and insurance companies are typically counterparties in more sophisticated risk mitigation transactions, such as credit deriva-

tives. SEB's credit policy requires the credit derivative counterparty to be of high credit quality. Closeout netting agreements are widely used for derivative, repo and securities lending transactions (while on-balance sheet netting is a less frequent practice).

All non-retail collateral values are reviewed at least annually by the relevant credit committees. Collateral values for watch-listed engagements are reviewed on a more frequent basis. The general rule is that the value of the collateral shall be calculated on the basis of the estimated market value of the asset. The market value shall be documented by an independent external valuation or, when applicable, by a well justified internal estimate.

The general control process for various credit risk mitigation techniques includes credit review and approval requirements, specific credit product policies and credit risk monitoring and control. The value of both the exposure and the mitigating collateral are monitored on a regular basis. The frequency depends on the type of counterparty, the structure of the transaction and the type of collat-

eral. The control process does differ among instruments and business units. For example, within the Large Corporates & Financial Institutions (LC&FI) division, there is a collateral management unit responsible for the daily collateralisation of expo-

sures in trading products, i.e., foreign exchange and derivatives contracts, repos and securities lending transactions.

→ See also the section counterparty credit risk on page 49.

Table 9. EU CR2 – Changes in the stock of non-performing loans and advances

SEK m		Gross carrying amount
31 Dec 2024		
010	Initial stock of non-performing loans and advances	9,113
020	Inflows to non-performing portfolios	8,423
030	Outflows from non-performing portfolios	–6,059
040	Outflows due to write-offs	–1,637
050	Outflow due to other situations	–4,422
060	Final stock of non-performing loans and advances	11,478

COMMENT

- Non-performing loans and advances increased from SEK 9.1bn to SEK 11.5bn in 2024. There were inflows due to negative risk migration and outflows due to both positive risk migrations and write-offs.

Table 10. EU CR3 – CRM techniques overview: Disclosure of the use of credit risk mitigation techniques

SEK m		a	b	c	d	e

1	Loans and advances	1,514,004	1,260,553	1,111,947	148,606	
2	Debt securities	177,228				
3	TOTAL	1,691,232	1,260,553	1,111,947	148,606	
4	of which non-performing exposures	5,150	3,217	2,584	633	

COMMENT

- Loans and advances include cash balances at central banks and other demand deposits. Excluding cash balances and loans to central banks, 60 per cent of the total loans and advances are secured, mainly by private housing mortgages or other real estate collateral.

Measurement of credit risk

Internal risk classification system

SEB's non-retail risk classification system is a central part of SEB's credit risk assessment of corporates, real estate management, financial institutions and specialised lending (Basel non-retail).

SEB's risk classification system is based on both qualitative and quantitative risk analysis and assesses the counterparty's financial risk and business risk profile, including environmental, social and governance aspects. Understanding repayment capacity by combining financial analysis and an assessment of ownership and management, and thorough knowledge of the customer's business model are key components of SEB's credit culture. In the risk classification, the obligor's risk profile is assessed both statistically and taking into account expert knowledge. Financial ratios, peer group comparison and scoring tools, external rating information and through-the-cycle analysis are used to enhance the risk assessment of the obligors. The result of the risk classification is reviewed by SEB's credit approval bodies in conjunction with review of the obligor and facilities at least once per year. Finally, the components of the risk classification system are reviewed and validated from a quantitative and qualitative perspective, including a use test, on a yearly basis.

Scoring systems

For the Basel retail segment, consisting of mainly mortgages and other retail exposures (private individuals and small businesses), SEB uses credit scoring systems when granting a credit and for estimating the probability of default for the customer. The customer is allocated to a PD pool of customers with similar PD. The most important factors of the credit scoring systems are measures of payment behaviour based on internal data for existing customers. New customers without a

history in the group are scored using publicly available information and well tested risk indicators. SEB uses local, customised credit scoring models for different regions and product segments, as both data accessibility and customer characteristics normally vary by country and product.

The risk classes provided by SEB's Risk Class Assignment (RCA) system and credit scoring systems are directly used in every credit risk decision as well as in the following areas:

1. setting of delegated credit approval limits
2. defining credit policy boundaries
3. credit portfolio monitoring and management
4. credit loss forecasting and provisioning
5. as an input to credit facility pricing
6. as an input to calculation of SEB's economic capital
7. as an input to calculation of SEB's risk-weighted exposure amount and regulatory capital.

Credit risk estimation

Credit risk is calculated for all assets, both in the banking book and the trading book. The methodology for calculating capital requirements and expected loss using the IRB approach addresses risk parameters including *Probability of Default* (PD), *Exposure at Default* (EAD), *Maturity* (M) and *Loss Given Default* (LGD). For portfolios that are approved for IRB Advanced modelling, the LGD and *Credit Conversion Factor* (CCF) are also modelled on both internal and external data.

Probability of Default

PD, or the risk that a counterparty defaults on its payment obligations, is measured through SEB's risk classification system and credit scoring systems.

For all non-retail portfolios, SEB has developed an internal risk classification system to assess the

risk of default on payment obligations.

The risk classification system includes specific rating tools and PD scales for significant segments such as large corporates, large real estate, institutions, and small and medium-sized enterprises (SMEs).

This enables a more accurate assessment of each segment based on SEB's internal historical portfolio performance. The large corporate, large real estate and institution segments are measured on a risk class scale of 1–16, including three "watch list" risk classes (13–15) and one risk class for defaulted counterparties (risk class 16). The SME segments are measured on a scale of 12 risk classes and have a separate nomenclature of A1–D2 plus watch list and default. For each segment, PD estimates, which are based on up to 20 years of internal default history, and external data, are derived.

The segment-specific rating scales are mapped onto a universal risk class scale covering 24 risk classes, each with different PD intervals. The risk class scale is shown below by PD interval and an approximate relation to two rating agencies' rating scales. Such relation is based on similarity between the method and the definitions used by SEB and these agencies to rate obligors. The mapping is based on SEB's PD scale and S&P's and Moody's published long-term default history per rating grade, which leads to a reasonable correspondence between SEB's mapping of risk classes onto S&P's and Moody's rating scales.

For the Basel retail segment, the PD values are organised in PD pools of counterparties with similar risk behaviour. All PD pools are adjusted through-the-cycle and show historically differentiated patterns of default, e.g., worse risk class pools display higher default ratios than better risk class pools in both good and bad times, similar to the non-retail RCA system.

Table 11. Structure of risk class scale in PD dimension

	Lower PD	Moody's	S&P
Investment grade	0.00%	Aaa	AAA
	0.02%	Aa	AA
	0.03%	Aa	AA
	0.04%	A	A
	0.05%	A	A
	0.07%	A	A
	0.10%	Baa	BBB
	0.14%	Baa	BBB
	0.20%	Baa	BBB
	0.29%	Baa	BBB

	0.57%	Ba	BB
	0.81%	Ba	BB
	1.14%	Ba	BB
	1.62%	B	B
	2.28%	B	B
	3.23%	B	B
	5%	B	B
	6%	B	B
	9%	B	B
Default	13%	Caa	CCC
	18%	C	C
	26%	C	C
Default	100%	Default	Default

Exposure at Default

EAD is measured in nominal terms for loans, bonds and leasing contracts; as a percentage of committed amounts for credit lines, letters of credit, guarantees and other off-balance sheet exposures; and, through current market values plus an amount for possibly increased exposure in the future, net of any eligible collateral, in the case of derivative contracts, repos and securities lending.

Loss Given Default

LGD represents an estimation of loss on an outstanding exposure in case of default and takes into account collateral provided and other loss mitigants. It is based on internal and external historical

experience for at least seven years and the specific details of each relevant transaction. LGD estimates for the performing portfolio are set to reflect the conditions in a severe economic downturn, which, for the Nordic portfolios, means that they are adjusted to the early 1990's economic downturn.

Maturity

M is calculated as the effective maturity of every transaction. In the case of simple term loan contracts with bullet repayment, M is the contractual repayment date. For amortising loans, M is shortened to reflect the reducing balance over time.

The risk parameters calculated for regulatory capital reporting are also used for stress testing and forms the foundation for SEB's methodology for credit risk. Here, risk estimates are combined in a portfolio model which also considers risk concentration to industrial and geographic sectors as well as large individual exposures.

As a member of the Global Credit Data Consortium (GCD) SEB participates in a data-sharing program where comparison of historical PD, EAD and LGD experience is possible with a large number of global banks. Pooled data is also used for estimating parameters for low default portfolios such as large corporates and banks.

Validation of rating systems

The performance of the risk rating and scoring systems is regularly reviewed according to group instructions. The validation is performed in order to secure that SEB's risk classification system is working satisfactorily and that it is used in accordance with external regulations and internal rules and instructions. The validation is performed by a unit within the risk organisation, which is independent of those responsible for risk class assignment of counterparties as well as those developing the models.

IRB approval

SEB was first approved to report legal capital adequacy using the internal ratings-based (IRB) approach for its main non-retail and retail mortgage portfolios in February 2007, when the Basel II framework came into force in Sweden. Since then, a number of portfolios and countries have been added.

For the parent company, SEB operates with an IRB-Advanced approval for all major portfolios and, since June 2017, with an IRB-Foundation approval for the sovereign portfolio. In the Baltic subsidiaries, SEB holds an IRB-Advanced approval for all major retail portfolios and an IRB-Foundation approval for its non-retail portfolio. As at 31 December 2024, 87 per cent (89) of the credit risk-weighted exposure amount and 96 per cent (97) of the total exposure value was covered by the IRB approach and only a minor number of portfolios were reported under the standardised method.

Adaptation of the bank's IRB models with regards to the EBA IRB repair program is ongoing and will continue during the forthcoming years.

Credit risk exposures under the standardised approach

The standardised approach is used for calculating risk-weighted exposure amounts for a number of minor portfolios, including some smaller sovereign exposures in certain foreign subsidiaries.

According to the regulation, either the rating from an export credit agency (such as the Swedish Export Credits Guarantee Board) shall be used, or, where not available, the country rating from eligible credit assessment agencies such as Moody's, S&P, Fitch and DBRS.

1) Investment in insurance business is included in the CR4 template, but presented on a separate row in the interim report.

2) Deferred tax assets, software assets, paid out pensions which the bank has unrestricted ability to use and significant holdings in financial companies, are included in the CR4 template, but presented on a separate row as Other exposures in the interim report.

COMMENT

- Only a small part of SEB's credit risk exposure is reported according to the standardised approach. The increase of exposure and RWA between June 2024 and December 2024 is explained by the acquisition of AirPlus International GmbH in August 2024. The whole AirPlus portfolio is calculated according to the standardised approach.

COMMENT

- The IRB approach is applied for the majority of SEB's credit risk exposures. For the parent company SEB operates with an IRB Advanced approval for all major portfolios and since June 2017, with an IRB Foundation approval for the sovereign portfolio. In the Baltic subsidiaries, SEB holds an IRB Advanced approval for all major retail portfolios and an IRB Foundation approval for the non-retail portfolio.

COMMENT

- As at 31 December 2024, 96.4 per cent of the credit risk exposure was calculated using the IRB approach, and only a few minor portfolios were reported according to the standardised approach.

Equity exposures not included in the trading book

Investments in associates held by SEB's venture capital unit have been designated as at fair value through profit or loss, in accordance with IAS 28. Therefore, these holdings are measured according to IFRS 9. All financial assets within SEB's venture capital business are managed and evaluated on a fair value basis in accordance with documented risk management and investment strategies.

Fair values for investments listed in an active market are based on quoted market prices. If the market for a financial instrument is not active, fair value is established by using valuation techniques based on discounted cash flow analysis, valuation with reference to financial instruments that are substantially the same, or valuation with reference to observable market transactions in the same financial instrument.

Strategic investments in associates on group level are accounted for using the equity method. Some entities where SEB has an ownership of less than 20 per cent have been classified as investments in associates. The reason is that the group is represented in the board of directors and participating in the policy-making processes of those entities.

Most of these investments are held for strategic reasons and are not intended to be sold in the near future.

→ Further information regarding accounting principles and valuation methodologies can be found in the Annual Report, note 1 and note 35. Further information regarding SEB's investments in associates can be found in the Annual Report, note 21.

Counterparty credit risk

Management of counterparty credit risk

Counterparty credit risk arises when SEB enters into derivative contracts and *Securities Financing Transactions* (SFTs) with a counterparty for instruments like futures, swaps, options, repos or securities lending transactions. The purpose for entering into derivatives contracts is primarily to support corporate customers and financial institutions in their management of financial exposures. This is managed within the *Large Corporates & Financial Institutions* (LC&FI) division. The treasury function also uses derivatives to protect cash flows and fair values of financial assets and liabilities in SEB's own book from market fluctuations. The counterparty credit risk in derivatives contracts and SFTs is the risk of a counterparty not living up to its contractual obligations where SEB has a claim on the counterparty.

Limits for counterparty exposures are set in the

regular credit process. The risk organisation identifies, measures, reports and follows up on SEB's counterparty credit risk. The risk is measured daily and reported monthly to the GRC and the RCC of the Board. Counterparty credit risk is monitored through a number of risk measures, including potential future exposure (PFE), nominal, tenor and settlement exposure measures. In addition, stress tests and sensitivity analyses are conducted to estimate effects of tail events, to stress test limits and understand sensitivities in the portfolio.

Wrong way risk (WWR) arises when exposure to a counterparty is negatively correlated with the counterparty's credit quality. There are two types of WWR; general and specific WWR. SEB has processes in place to identify and monitor counterparties and transactions where the WWR is inherent. Specific WWR is considered in the credit review process and is measured daily.

Settlement risk is measured for foreign exchange

(FX) transactions. The amount at risk is equal to the FX settlement amount. FX settlement risk is taken into account by all decision-making bodies that decide on counterparty limits for instruments which imply FX settlement risk. FX settlement limits are in place for all counterparties trading in instruments with FX settlement risk.

Measurement of counterparty credit risk

Since the market value of a derivative fluctuates during the term to maturity, the uncertainty of future market conditions must be taken into account when measuring the credit exposure of derivatives. For risk management purposes, the PFE is calculated either through simulation using an internal model method or by applying a standard add-on to the current market value. The add-on depends on product type and time to maturity which reflects potential market movements for the specific contract.

For calculation of regulatory capital for counterparty credit risk, SEB uses the internal model method (IMM) for repos, interest rate derivatives and FX derivatives for the parent company, which was approved by the Swedish FSA in December 2015. The internal model method takes close-out netting agreements and collateral agreements into account. The setup of the internal model automatically detects specific wrong-way risk transactions and collateral, the exposures of which are calculated gross. The internal models are regularly validated and back-tested.

For other derivatives (mainly equities) in the parent company and for other legal entities of the group, SEB uses the standardised approach (SA-CCR). For securities lending transactions SEB is using the *Financial Collateral Comprehensive Method* (FCCM).

6	TOTAL					176,624	176,624	176,624	23,738

COMMENT

- Overall, RWEA has increased by SEK 3.1bn mainly due to higher exposure in derivatives (SEK 10bn) and SFTs (SEK 20.5bn) compared to 30 June 2024.

Counterparty credit risk in derivative contracts affects SEB's profit and loss through credit/debit valuation adjustments (CVA/ DVA), reflecting the credit risk associated with the derivative positions.

These adjustments depend on market risk factors such as interest rate, FX and credit spreads. SEB uses the standardised approach to calculate the regulatory capital requirement for CVA.

Table 21. EU CCR2 – Transactions subject to own funds requirements for CVA risk

SEK m		a		b	
		31 Dec 2024		30 Jun 2024	
		Exposure value	RWEA	Exposure value	RWEA
1	Total transactions subject to the Advanced method				
2	(i) VaR component (including the 3x multiplier)				
3	(ii) stressed VaR component (including the 3x multiplier)				
4	Transactions subject to the Standardised method	48,757	5,461	52,023	9,574
EU4	Transactions subject to the Alternative approach (Based on the Original Exposure Method)				
5	Total transactions subject to own funds requirements for CVA risk	48,757	5,461	52,023	9,574

COMMENT

• CVA RWEA decreased compared to 30 June 2024, mainly driven by a decrease in EAD.

COMMENT

• Counterparty credit risk exposures under the standardised approach decreased compared to 30 June 2024, mainly due to decreased exposures to central counterparties.

COMMENT

- The IRB approach is applied for the majority of SEB's counterparty credit risk exposures.

Netting and collateral management

Counterparty credit risk in derivatives, repo and securities lending transactions is reduced through the use of close-out netting agreements, where all positive and negative market values under an agreement can be netted at the counterparty level. The netting agreement is often supplemented with a collateral agreement where the net market value exposure is reduced further by collateralisation.

Netting and collateral agreements can contain rating triggers. SEB has a restrictive policy in re-

spect of rating-based levels for thresholds and minimum transfer amounts. In addition, asymmetrical rating trigger levels require specific approval from a deviation committee. Rating-based thresholds are only accepted for a restricted number of counterparties, hence if SEB was to be downgraded, the impact would be limited. In the event of a downgrade, SEB would need to post additional collateral of approximately SEK 25m in case of a one-notch downgrade and approximately SEK 476m in case of a two-notch downgrade.

Furthermore, as a general rule, rating triggered

termination events are not accepted.

Counterparty credit risk can also be mitigated by steering exposure and risks to clearing houses, which is common for a range of products to reduce bilateral counterparty credit risk. Risk can also be closed out through various portfolio compression activities. A small part of the counterparty credit risk exposure is reduced by credit derivatives. SEB conducts credit derivative transactions primarily in connection with counterparty credit risk and mainly trades with counterparties where an ISDA CSA agreement has been established. Rather than

using credit derivatives to mitigate counterparty credit risk in its trading operations, SEB prefers to make use of collateral arrangements.

SEB mitigates settlement risk through Delivery-vs-Payment (DVP) or Payment-vs-Payment (PVP) arrangements when possible. One such settlement vehicle is the global FX clearing that is conducted through CLS Group (originally Continuous Linked Settlement), where SEB is a member. They eliminate settlement risk in FX transactions with counterparties that are eligible for CLS clearing.

9	TOTAL	34,102	88,532	23,326	26,605	9,961	539,298		238,273

COMMENT

• Compared with 30 June 2024, there is a SEK 165bn increase in value of collateral used in CCR exposures related to derivative transactions and SFTs.

Table 25. EU CCR6 – Credit derivatives exposures

SEK m		a	b	a	b
		31 Dec 2024		30 Jun 2024	
	Collateral type	Protection bought	Protection sold	Protection bought	Protection sold
	Notionals				
1	Single-name credit default swaps		454	159	629
2	Index credit default swaps	4,278	1,066	655	2,592
3	Total return swaps				
4	Credit options				
5	Other credit derivatives				
6	Total notionals	4,278	1,520	814	3,221
	Fair values				
7	Positive fair value (asset)		169		373
8	Negative fair value (liability)	–27		–50	–5

COMMENT

- Compared with 30 June 2024, the notional amount of bought credit derivatives has increased by SEK 3.5bn, but notional amount of sold credit derivatives has decreased by SEK 1.7bn. The fair value of all credit derivatives has decreased by SEK 175m.

Table 26. EU CCR8 – Exposures to CCPs

SEK m		a		b	
		31 Dec 2024		30 Jun 2024	
		Exposure value	RWEA	Exposure value	RWEA
1	Exposures to QCCPs (total)		705		808
2	Exposures for trades at QCCPs (excluding initial margin and default fund contributions); of which	5,230	105	6,256	125
3	(i) OTC derivatives	3,063	61	4,655	93
4	(ii) Exchange-traded derivatives	2,160	43	1,594	32
5	(iii) SFTs	7	0	7	0
6	(iv) Netting sets where cross-product netting has been approved				
7	Segregated initial margin	11,429		11,486	
8	Non-segregated initial margin	1,532	31	2,483	50
9	Prefunded default fund contributions	3,231	570	3,552	633
10	Unfunded default fund contributions	3,326		3,645	
11	Exposures to non-QCCPs (total)				
12	Exposures for trades at non-QCCPs (excluding initial margin and default fund contributions); of which				
13	(i) OTC derivatives				
14	(ii) Exchange-traded derivatives				
15	(iii) SFTs				
16	(iv) Netting sets where cross-product netting has been approved				
17	Segregated initial margin				
18	Non-segregated initial margin				
19	Prefunded default fund contributions				
20	Unfunded default fund contributions				

COMMENT

- Since 30 June 2024, exposure and RWEA towards QCCPs slightly decreased by SEK 1bn and SEK 103m respectively, mainly driven by lower exposure in OTC derivatives.

Securitisations

SEB does not regularly securitise its assets and has no outstanding own issues. In addition, the group does not operate any *Asset Backed Commercial Paper* (ABCP) conduit or similar structure. SEB provides financing to certain clients through a small number of asset-backed transactions, backed by consumer loans and auto lease- and loan receivables. The transactions are funded on balance by SEB with commitments between one and three years.

The securitisation positions are accounted for as

loans and receivables and reported according to the external ratings-based approach for capital adequacy purposes. In some transactions, SEB acts as hedge counterparty with back-to-back transactions to the originators. The transactions are backed by granular pools of receivables to private individuals and/or corporates. There are no credit default swap hedges. All holdings are performing and amortise according to schedule. Stress tests are performed on a monthly basis, taking underlying levels of the positions into consideration.

Table 27. EU SEC1 – Securitisation exposures in the non-trading book

SEK m	31 Dec 2024			30 Jun 2024		
Traditional securitisation	STS	Non-STS	Sub-total	STS	Non-STS	Sub-total
Total exposures	12,367	4,452	16,819	11,172	4,305	15,477
Retail (total)		3,620	3,620		3,500	3,500
<i>of which other retail exposures</i>		3,620	3,620		3,500	3,500
Wholesale (total)	12,367	832	13,199	11,172	805	11,977
<i>of which lease and receivables</i>	12,367	832	13,199	11,172	805	11,977

COMMENT

- *Securitisation exposures increased by SEK 1.3bn compared to 30 June 2024, mainly explained by increased STS exposures. The majority of SEB's securitisation exposure is AAA-rated. SEB only acts as investor.*

COMMENT

- *Securitisation exposures increased by SEK 1.3bn compared to 30 June 2024, mainly explained by increased STS exposures. The majority of SEB's securitisation exposure is AAA-rated. SEB only acts as investor.*

Market risk

Market risk is the risk of losses in on- and off-balance sheet positions arising from adverse movements in market prices. Market risk can arise from changes in interest rates, foreign exchange rates, credit spreads, CVA, commodity and equity prices, implied volatilities, inflation and market liquidity.

Risk management

A clear distinction is made between market risks related to trading activity, i.e., trading book risks, and structural market and net interest income risks, i.e., banking book risks. Whereas positions in the trading book are held with a trading intent and held under a daily mark-to-market regime, positions in the banking book do not have a trading intent and are typically held at amortised cost.

Market risk in the trading book arises from SEB's customer driven trading activities. The trading activities are performed by the *Large Corporate & Financial Institutions* (LC&FI) division in its capacity as market maker for trading in foreign exchange, equity and capital markets. In addition to the customer driven flows, market risk also arises from funding and liquidity management activities within the treasury function. While not included in the regulatory trading book, for internal risk management purposes and measurements, SEB monitors and controls the market risk resulting from funding and liquidity purposes as if it were in the trading book.

Market risk in the banking book arises in the form of interest rate risk as a result of interest rate repricing mismatches between assets and liabilities. The treasury function has the overall responsibility for managing these risks, which are consolidated centrally through the internal funds transfer pricing system. The interest rate risk in the banking book is managed using fixed income securities and interest rate derivatives as hedge products.

Small market risk mandates are granted to subsidiaries where cost-efficient, in which case the treasury function is represented on the local *Asset and Liability Committee* (ALCO) for co-ordination and information-sharing. The centralised treasury operations create a cost-efficient matching of liquidity and interest rate risk in all non-trading related business. The treasury function also

manages the liquidity portfolio, which is part of SEB's liquid assets. From a capital adequacy perspective, this portfolio is categorised as assets in the banking book while from a risk management perspective, it is monitored as a trading related market risk.

Finally, market risk also arises in the bank's traditional life insurance activities and in the de-

financed benefit plans as a result of mismatches between the market value of assets and liabilities. Market risks in the life insurance business and pension obligations are considered insurance risk and pension risk, respectively, and are not included in the market risk figures presented further below.

Market risk types

Interest rate risk: Interest rate risk is the risk of loss or reduction of future net income following changes in interest rates, including price risk in connection with the sale of assets or closing of positions. SEB uses VaR, Delta 1% and Pillar 2 stress test scenarios defined by the EBA (also used by the Swedish FSA).

Net interest income (NII) risk: The NII risk depends on the overall business profile, particularly mismatches between interest-bearing assets and liabilities in terms of volumes and repricing periods. The NII risk is also exposed to a so-called "floor" risk. Asymmetries in product pricing create a margin squeeze in times of low interest rates, making it relevant to analyse both upward and downward changes. SEB uses stress test scenarios defined by the EBA to limit NII risk in addition to internally defined stress test scenarios reflecting stressed market conditions.

Credit spread risk: Credit spread risk is the risk of loss or reduction of future net income following changes in credit spreads, including price risk in connection with the sale of assets or closing of

positions. As opposed to credit risk, which applies to all credit exposures, only assets that are marked to market are exposed to credit spread risk. Credit spread risk is measured by Value-at-Risk (VaR).

Foreign exchange (FX) or currency risk: FX risk arises both through SEB's FX trading and through its operations in various currencies. While FX trading positions are measured and managed within the overall VaR framework, the group measures and manages the structural FX risk inherent in the structure of the balance sheet and earnings separately. FX risk is monitored and limited using single and aggregated FX measures and VaR.

Equity price risk: Equity price risk arises in connection with market making and trading in equities and related instruments. VaR is the main risk measure for equity price risk, complemented with sensitivities for derivative positions.

Commodity price risk: Commodity price risk is the risk associated to the movements of commodity prices including cost of closing out the positions,

and arises in customer-driven trading in commodities. Commodity price risk is measured by VaR, and other sensitivity and exposure measures.

Volatility risk: Volatility risk is defined as the risk of a negative financial outcome due to changes in the implied volatility. The price of an option contract is dependent on the estimate of future volatility of the underlying asset as quoted in the market, i.e., implied volatility. Volatility risk is measured by VaR.

Inflation risk: Inflation risk is the risk of losses in inflation-linked products due to changes in inflation.

Market liquidity risk: Market liquidity risk is the risk of loss in connection with the sale of assets or closing of positions due to bid-ask spread widening.

Credit value adjustment (CVA) risk: CVA arises from variations in the counterparty credit risk based on the expected future exposure. CVA is fundamentally credit risk, but the exposure is calculated using market risk drivers. Main risk drivers include credit spreads, interest rates and currency.

Market risk limits and control

A market risk framework is in place to ensure proper oversight of all types of market risks, including both the trading-related risks, the market risk in the banking book and the market risk related to fair value adjustments. The Board of Directors defines the level of acceptable market risk by setting overall market risk limits and general instructions. The limits are based on recommendations from the *Board's Risk and Capital Committee* (RCC), upon proposals made by the CRO. The *Group Risk Committee* (GRC) delegates the market risk mandate set by the Board of Directors to the divisions and treasury function which, in turn, further delegate the limits internally. The Board of Directors has decided on a number of key risk measures to limit the total market risk exposure: *Value-at-Risk* (VaR), Delta 1%, Aggregated FX and stop-loss limits, maximum losses in stress tests of economic value of equity and net interest income and valuation uncertainty in fair value positions for capital. Limits are reviewed as part of a sweeping annual process, as well as on an ad-hoc basis throughout the year, if deemed necessary.

Within the divisions and the treasury function, limits are also imposed on different positions and sensitivity measures and stress tests are conducted as appropriate.

The risk organisation measures, follows up and reports on the market risk taken by the various units within the group on a daily basis, using reports generated by departments within risk management as well as more direct access to front-office trading systems. The risk control function is present in the trading room and monitors limit compliance and market prices at closing, as well as valuation standards. Risk control also participates in the introduction of new products through the bank's internal *New Product Approval*

Process (NPAP), ensuring that new products can be properly risk managed before trading.

Market risks are reported on a monthly basis to the GRC and the RCC. If deemed necessary, based on for example extreme market risk developments, ad-hoc reporting on a more frequent basis can occur. The risk organisation independently verifies prices and the valuation of positions held at fair value and calculates the prudent valuation capital buffers. Prudent valuation capital adjustments are taken across all fair value balances.

Measurement of market risk

When assessing the market risk exposure, SEB uses measures that capture losses under normal and stressed market conditions. Market risks under normal market circumstances are measured using *Value-at-Risk* (VaR) and *Expected Shortfall* (ES), as well as specific measures that are relevant for the various risk types. These measures are complemented by stress tests and scenario analyses, in which potential losses under extreme market conditions are estimated. Since no method can cover all risks at all times, several approaches are used, and the results are assessed based on judgment and experience. Adaptation of the market risk models with regards to the ongoing Interest Rate Benchmark reform and the fallback to the alternative risk-free reference rates is ongoing and will continue during the forthcoming years.

The market risk measurement framework uses a mix of validated and widely used third-party provided specialised risk management software, and in-house developed tools for reporting and data aggregation. A Risk Data Delivery platform ensures proper delivery of position data from front office systems to the independent risk management systems.

VaR and Stressed VaR

VaR expresses the maximum potential loss that could arise during a certain time period with a given degree of probability. SEB uses a historical simulation VaR model with a ten-day time horizon and 99 per cent confidence interval. To arrive at the ten-day horizon, SEB uses scaled 1-day VaR, based on a 1-year lookback of unweighted historical observations, with daily updates to data. Observations constitute a mix of relative and absolute price returns, depending on what is appropriate for the specific risk factor. The VaR calculations are run daily and used to measure, limit and report VaR. The model aggregates market risk exposures for all risk types and covers a wide range of risk factors in all asset classes, after carrying out the VaR calculations with full revaluation.

SEB also uses a stressed VaR measure (SVaR), where VaR calculations for the current portfolio are with the same parameters as for regular VaR, but performed using market data from a historic, turbulent time period covering the Lehman Brothers default (April 2008–April 2009). The chosen period is evaluated annually, based on severity and applicability, to ensure that it continues to represent the most suitable stressed period, evaluated based on severity and applicability.

In the day-to-day risk management of trading positions, limits and exposures are also followed up with a one-day time horizon.

A limitation of the VaR model is that it uses historical data to estimate potential market changes. As such, it may not predict all outcomes, especially in a rapidly changing market. Also, VaR does not take into account any risk mitigating actions as the model assumes that the portfolio is unchanged, over the VaR-horizon.

SEB does not currently have approval for handling of specific risk within the VaR framework.

The capital charge for that risk is therefore calculated separately according to the standardised method.

Back-testing of the regulatory VaR model

To verify and assure the model's accuracy, the VaR model is back-tested on a daily basis by comparing the last 250 daily VaR estimates with the profit or loss for the corresponding days, using the actual profit and loss figures for one test set, and the theoretical profit and loss figures for another test set.

Back-testing is used to verify that actual and hypothetical losses do not exceed the VaR level in more than one per cent of the trading days in line with the model confidence level. The daily theoretical result is calculated from end-of-day positions using full revaluation and updated market data. The daily actual result is calculated from end-of-day trading profit and loss figures, excluding sales, fees and commissions. Back-testing is performed on desk level as well as on aggregated level, for both the theoretical and the actual result. Daily monitoring and evaluations on both the total aggregated level and the desk levels provide insight into the performance of the VaR model.

Table 29. EU MR4 – Comparison of VaR estimates with gains/losses

SEK m

150

**COMMENT**

- During 2024 there were no hypothetical or actual back testing breaches. The capital multiplier from back testing breaches remains at the minimum level.

Table 30. Trading book VaR and Stressed VaR

SEK m	Value at Risk (99 per cent, ten days)					SEK m	Stressed Value at Risk (99 per cent, ten days)				
	Min	Max	31 Dec 2024	Average 2024	Average 2023		Min	Max	31 Dec 2024	Average 2024	Average 2023
Commodities risk	14	51	42	26	38	Commodities risk	22	76	54	43	100
Credit spread risk	43	95	44	71	78	Credit spread risk	139	266	139	205	163
Equity risk	3	62	6	16	21	Equity risk	6	265	37	33	60
Foreign exchange risk	65	193	88	108	204	Foreign exchange risk	138	408	268	280	353
Interest rate risk	70	189	103	129	217	Interest rate risk	267	486	377	355	350
Volatilities risk	5	22	9	11	22	Volatilities risk	26	73	31	38	39
Inflation risk	7	13	7	11	11	Inflation risk	10	14	10	12	12
Diversification	-90	-353	-184	-199	-274	Diversification	-313	-986	-519	-545	-584
TOTAL	117	273	117	174	318	TOTAL	296	602	398	421	493

COMMENT

- The 10-day VaR in SEB's trading related activities was significantly lower in 2024 compared to 2023, owing to lower market volatility, and reduced exposure. Note that this table contains the approved IMA calculations and additional IMA components that are pending regulatory approval.

Table 31. Banking book VaR

SEK m	Value at Risk, (99 per cent, ten days)				
	Min	Max	31 Dec 2024	Average 2024	Average 2023
Credit spread risk	60	114	62	76	138
Equity price risk	3	20	3	8	35
Foreign exchange rate risk	0	20	12	5	3
Interest rate risk	310	662	341	426	677
Diversification	-81	-136	-82	-97	-160
TOTAL	292	679	335	418	693

COMMENT

- The average banking book VaR decreased from SEK 693m in 2023 to SEK 418m in 2024. The decrease is primarily driven by lower volatility, but also reduced risk exposure.

Table 32. EU IRRBB1 – Interest rate risks of non-trading book activities (banking book)

SEK m	Supervisory shock scenarios	a	b	c	d
		Changes of the economic value of equity		Changes of the net interest income	
		31 Dec 2024	30 Jun 2024*	31 Dec 2024	30 Jun 2024*
1	Parallel up	-931	-729	6,777	4,301
2	Parallel down	-908	-2,578	-9,496	-5,519
3	Steepener	-1,211	-2,005		
4	Flattener	-51	-282		
5	Short rates up	-482	-723		
6	Short rates down	-2,617	-3,701		

COMMENT

- This template provides information on the risks arising from potential changes in interest rates that affect both the economic value of equity (EVE) and the net interest income (NII) of the non-trading book activities referred to in Article 84 and Article 98(5) CRD. Positive EVE changes in each currency are weighted by a factor of 50 per cent. Behavioural assumptions on non-maturity deposits are considered for both EVE and NII perspective. The longest repricing maturity of non-maturity deposits is set to one year based on expert judgement assumption.

*The numbers for June were incorrect in the Q2 2024 report, and have been corrected in the Q4 2024 report.

Expected Shortfall

Expected Shortfall (ES) is the expected loss given a pre-defined time horizon, conditional that the loss is greater than the VaR for a specific confidence level. Thus, while VaR only shows the loss at a specific confidence level, ES will take the whole loss distribution into account and calculate the expected loss of all of the worst outcomes. ES is currently used within SEB to calculate the economic capital for market risk of trading and liquidity management purpose positions.

Stress tests and scenario analysis

Scenario analysis and stress tests are a key part of the risk management framework, complementing the VaR measure. In particular, they test the portfolios using scenarios other than those available in the VaR simulation window and cover longer time horizons and more diverse scenarios. The 99 per cent confidence level used in the VaR model implies that a loss exceeding the VaR figure is expected once every 100 days. By using a more extensive set of market data scenarios than available in the simulation window of the VaR model, stress testing makes it possible to estimate losses in sce-

narios that are more severe than the VaR 99 per cent scenario.

SEB stresses its portfolios by applying extreme movements in market factors which have been observed in the past (historical scenarios) as well as extreme movements that could potentially happen in the future. The movements could either be forwardlooking and hypothetical or be based on observed historical movements. To further incorporate all possible events, the group complements the historical and hypothetical scenarios with reverse stress tests, which start from an outcome where, for example, a stop-loss limit would be breached and then identifies circumstances where this might occur. This type of analysis provides management with a view on the potential impact that large market moves in individual risk factors, as well as broader market scenarios, could have on a portfolio. The risk appetite framework includes limits on maximum losses in various stress test scenarios and some max loss in stress scenarios are included in daily monitoring.

Interest Rate Risk in the Banking Book

Interest rate risk stress testing of non-trading activities is assessed with both economic value of equity (EVE) measures based on scenarios defined by EBA and additional scenarios which quantify the changes in net present value of interest sensitive instruments, and with net interest income (NII) measures based on scenarios defined by EBA which measure changes in future earnings within a specific time horizon. A run-off balance sheet is applied for EVE risk calculations and commercial margins are excluded, while a static balance sheet is applied for NII risk calculations. Credit spread risk is also assessed for assets that are marked to market (liquidity portfolio).

SEB considers behavioral assumptions on non-maturity deposits (NMDs) for both EVE and NII perspective. NMDs are defined as deposits in

which the customer is free to withdraw its money at any time. At the same time, SEB can change the customer rate on a daily basis. Despite NMDs being treated as overnight liabilities, a portion of the NMDs is likely to stay on SEB's balance sheet while also being rate-insensitive to large interest rate shocks. Non-maturity deposits drive behavioral interest rate risk, as the customer rates do not follow official market rates, and are set at the discretion of the business, often taking customer behavior, customer rights regulation, competition etc. into account.

SEB has set up a committee with members from the business, treasury and risk organisation, which assist in assessing the validity of the prevailing assumptions. A validation of the non-maturity deposit model is performed yearly by a unit within the risk organisation, which is independent of those responsible for developing the model.

In the table EU IRRBB1, the longest repricing maturity of non-maturity deposits is set to one year based on expert judgment assumption.

Risk type-specific measures

As complementary analytical tools, SEB uses sensitivity and position measures as appropriate to the various instruments and risk types:

Delta 1%

SEB uses both gross and Net Delta 1% to measure interest rate risk sensitivity in the trading and banking books. Both measures are calculated for interest rate-based products and measure the change in market value following a simultaneous one percentage point parallel shift in interest rates for all currencies.

Aggregated FX positions

While foreign exchange (FX) trading positions are measured using VaR, the structural FX risk inherent in the structure of the balance sheet and earnings

are measured separately through an aggregate FX limit. The aggregated FX is obtained by calculating the sum of all short non-SEK positions and the sum of all long non-SEK positions. The aggregated FX is the larger of these two sums, in absolute value.

Stop-loss limits

Stop-loss limits are used throughout the group's trading activities. A stop-loss limit is a specified loss amount at which loss limiting measures must be executed in order to restrict potential losses of a position, portfolio or entity. Since it focuses on actual losses, the stop-loss framework covers all risk events and risk drivers and helps limit losses under stressed market conditions.

Table 33. EU MR1 – Market risk under the standardised approach

SEK m	a	
	31 Dec 2024	30 Jun 2024
	RWEAs	RWEAs
Outright products		
1 Interest rate risk (general and specific)	7,437	7,507
2 Equity risk (general and specific)	160	277
3 Foreign exchange risk		
4 Commodity risk		
Options		
5 Simplified approach		
6 Delta-plus method		0
7 Scenario approach		
8 Securitisation (specific risk)		
9 TOTAL	7,597	7,784

COMMENT

• Market risk under the standardised approach is primarily driven by charges related to specific risk, and changes are driven by changed positioning due to macroeconomic developments.

Other sensitivity measures

SEB also uses other greeks as risk measures, such as vega and gamma, both for internal reporting and internal risk limiting on the desk level, for certain products (notably, equity derivatives).

Valuation control and model validation

The group has an established control environment for the determination of fair values of financial instruments that includes a review, independently from the business, of valuation models and prices, implemented by the model validation and independent price verification (IPV) processes. If the validation principles are not adhered to, escalation procedures are in place and the Heads of Group Finance and Group Risk are informed. Exceptions with material and principal importance require

approval from the Valuation Committee and the SEB ARC (Accounting Policy and Financial Reporting Committee).

For some of the group's financial assets and liabilities, especially for certain derivatives, quoted prices are not available, and valuation models are used to estimate fair value. As part of the fair value measurement, valuation adjustments are made when valuing derivative financial instruments, to incorporate such as counterparty and own credit risk. The group applies capital reserves for valuation uncertainty based on its prudent valuation framework. The methodologies for estimating valuation adjustments are continuously revised as a result of changing market practices in response to regulatory and accounting policy changes, as well as general market developments.

COMMENT

• Increase in REA partially driven by higher VaR and SVaR. As detailed elsewhere, the higher averages followed due to changes in positioning.

Capital requirement for market risk in the trading book

SEB's internal VaR and SVaR models have been approved by the Swedish FSA for calculation of regulatory capital requirements for all the general market risks in SEB's trading book for SEB AB and the consolidated group. An immaterial set of positions belonging to the equity risk classification are calculated using the standardised approach.

The capital requirement for remaining market risks in the trading book is calculated using the standardised approach, notably for example the specific market risk. The capital requirements for specific risk and general market risk are then aggregated. The break-down of risk exposure amount and the corresponding capital requirements are shown in table 33.

Table 35. EU MR3 – IMA values for trading portfolios

SEK m	a	a

12	TOTAL Additional Valuation Adjustments (AVAs)						1,381	731	650

COMMENT

- The total prudent valuation capital reserve of SEB Group increased from SEK 1,381m to SEK 1,489m during 2024, with an upturn in AVA at the end of the first quarter as valuations for alternative investment equities increased. The capital reserve increased in the second quarter as cross currency derivative delta exposure increased. The third quarter remained relatively stable overall as a temporarily added reserve for alternative investments was offset by a decrease in cross currency derivative delta exposure. The final quarter saw tighter spreads and the removal of the temporary alternative investments reserve, resulting in a reduced reserve overall. Year-on-year increases were observed on XVA and alternative investment reserves while decreases were noted on bond-and derivative-related AVAs.

Operational risk

Operational risk is the risk of loss resulting from inadequate or failed internal processes, people and systems or from external events.

Risk management

SEB has a regulatory approval to use the Advanced Measurement Approach (AMA) to calculate the capital requirement for operational risk.

Operational risk, in SEB referred to as non-financial risk, is inherent in all of SEB's operations. While the day-to-day management of operational risk is the responsibility of SEB's business divisions and support functions, where these risks are generated, the Non-Financial Risk (NFR) unit oversees the group-wide management of operational risks, identifies and reports risk concentrations, and promotes a consistent way of working across the bank. The NFR unit is a part of the CRO Function headed by the CRO.

SEB aims to maintain a sound risk culture to limit operational risks, by ensuring a structured and consistent usage of risk mitigating tools and processes. In the Group Risk Policy and the Non-

financial Risk Instruction, SEB's Board of Directors has defined the overall aim and principles for identification, management, monitoring and reporting of operational risk. These documents are supplemented by additional instructions and guidelines.

As the first line of defence, the divisions and staff functions own the risks arising in their operations, including third party/outsourcing arrangements.

All managers in SEB are responsible for identifying, managing, monitoring and reporting operational risks in their operations. Furthermore, the risk managers in the business are explicitly assigned to address operational risks. Within the framework of their responsibilities, the first line risk managers not only assist the business in their day-to-day management of operational risk, but also ensure implementation of an effective risk management and that internal controls are carried

out in accordance with the group's instructions and guidelines.

The risk organisation is responsible for ensuring that SEB's operational risks are identified, managed, monitored, and reported and for making sure that these risks are addressed in accordance with external and internal regulations. The risk organisation reports to SEB's senior management, the *Group Risk Committee* (GRC) and the *Board's Risk and Capital Committee* (RCC) on a regular basis. The objective is to inform on the group's exposure to operational risk, mitigating actions and recommendations to further reduce the operational risks.

These reports also include the degree of compliance with the non-financial risk appetite measures and SEB Group key risk indicators, information on significant incidents, and in-depth analyses of operational risks. The SEB group's non-financial risk appetite measures consist of quanti-

tative measures that translates the Board's risk appetite statements into measurable thresholds which SEB is expected to operate within.

Cyber security, data management and model risk

SEB continuously strives to improve its framework and risk practices to mitigate existing and emerging risks. The continued global tensions and global connectivity, increased usage of cloud services, third party vendors and outsourcing are megatrends in the banking industry that at the same time increase the risk of cybercrime. SEB proactively works with threat scenarios, threat intelligence and risk management to minimise this risk.

To protect SEB's intellectual property, customer data and other sensitive information from unauthorised access by cyber criminals, activities to identify, protect against, detect, respond to, and recover from cybercrime are continuously devel-

Examples of tools and processes used in SEB to continuously identify and manage operational risk:

Incident management

All employees are required to register incidents so that risks can be properly identified, managed, monitored and reported. The information is analysed by both the first and second lines of defence analysing risk events, key metrics, and other relevant operational risk data to evaluate operational risk exposures.

Risk and control self-assessments

All business units with significant risk embedded in their operations shall regularly complete *Risk and Control Self-Assessments* (RCSA) according to a group-wide methodology. Assessments are based on their consolidated operations and are designed to identify, and mitigate operational risks embedded in the process end-to-end.

Business continuity management

Business continuity management (BCM) is the process of ensuring that the organisation is prepared to respond to and operate through a period of major disruption. SEB's BCM framework provides methods and processes to ensure readiness to recover, resume and maintain business critical functions and processes.

Crisis management

Crisis Management Teams (CMTs) are established on group, country, and divisional level to ensure quick response and management of serious disruption in order to protect lives, health and assets of employees, customers, and other stakeholders.

New product approval process

All new or changed products, processes and/or systems as well as re-organisations are evaluated in a group-common *New Product Approval Process* (NPAP). The aim is to identify potential operational risks and ensure that pro-active measures are taken to protect SEB from entering into unintended risk-taking.

Model risk management

The use of models always gives rise to model risk, which is the potential for adverse consequences from decisions based on incorrect or mis-used model outputs and reports. The aim of SEB's *Model Risk Management* (MRM) framework is to provide guidance on effective model risk management to ensure sufficient controls are in place to manage the model risk arising from the use of models.

oped. Security updates, system upgrades and security tests are performed on a regular basis. Using “always verify” and “least privilege access” principles along with technical safeguards provide additional protection and the visibility needed to manage and monitor every device, user, application, and network.

One of the most fundamental parts of successfully protecting SEB’s intellectual property, customer data and other sensitive information is to foster a sound risk culture throughout the bank and to raise security awareness, not only among the employees, but also among SEB’s customers. This is done through e.g. trainings and regular communication. In addition, SEB has adopted a group-wide cyber risk and cybersecurity instruction.

Data management and data ethics continue to grow in importance as the financial industry becomes increasingly data centric. In addition, correct and timely data is part of growing regulatory requirements. SEB’s efforts to counteract the risk

of money laundering and the use of third-party arrangements increase the need for adequate data management and data processing. SEB’s well defined processes for managing such risks are continuously adapted. In recent years, SEB has established a group-wide information governance framework, including data management tools and processes.

Model risk is another area affected by evolving regulatory requirements. SEB has implemented a model risk policy framework, and significant improvements have been made to the independent validation of models used for financial crime prevention, pricing of lending products and algorithmic trading.

Fraud prevention

As a bank, SEB is exposed to the risk of being used for corruption, money laundering and financing of terrorism. Work to strengthen SEB’s defence against money laundering continues to be of high

priority. This includes regular risk assessments, risk-based customer due diligence processes and efficient transaction monitoring. In addition, SEB has implemented a group wide framework for external fraud risk.

Measurement of operational risk

SEB’s regulatory approval to use the AMA model to calculate the capital requirement for operational risk is a confirmation of SEB’s experience and expertise in operational risk management, including incident reporting, operational loss reporting, capital modelling and quality assessment of processes.

Applying the AMA model, SEB quantifies operational risk with a loss distribution approach, using internal data and external operational losses in the global financial sector. The AMA model is structured along the regulatory-defined business lines for operational risk where SEB’s business volume serves as a risk estimate in the modelling. Once the

capital requirement for the group has been calculated, it can be allocated between the divisions in a fashion that is similar to the methodology used in the standardised approach, using the AMA model’s capital multipliers to assess each business line’s risk level. The quality of the divisions’ risk management, based on their self-assessments, is also considered.

The capital requirement for operational risk is not affected by any external insurance agreement to reduce or transfer the impact of operational risk losses.

The Basel Committee has decided on a standardised approach to calculate the regulatory capital requirement for operational risk, which will replace all existing methods including the AMA models.

The standardised approach will be implemented in the EU on 1 January 2025, and the approach is built on multipliers relative the banks’ financial income. SEB will continue to use its AMA model for economic capital purposes.

Table 37. Operational risk incidents registered and analysed

COMMENT

- Net losses from operational incidents amounted to SEK 358m (154).

Table 38. EU OR1 – Operational risk own funds requirements and risk-weighted exposure amounts

COMMENT

- The total capital requirement for operational risk was SEK 4.7bn (4.3) at the end of 2024. The acquisition of AirPlus in 2024 increased the capital requirement for operational risk by SEK 0.3bn.

Liquidity risk

Liquidity risk is the risk that the group is unable to refinance its existing assets or is unable to meet the demand for additional liquidity. Liquidity risk also entails the risk that the group is forced to borrow at unfavourable rates or is forced to sell assets at a substantial loss to meet its payment commitments.

Risk management

The aim of SEB's liquidity management is to ensure that the group maintains a well-controlled liquidity risk profile, with sufficient volumes of liquid assets in all relevant currencies, enabling it to meet its liquidity needs in all foreseeable circumstances, without incurring significant cost increase. The treasury function has the overall responsibility for liquidity management and funding strategy and is supported by local treasury centres in the group's major markets.

The Board of Directors has established a comprehensive framework for managing the bank's liquidity requirements in the short- and long-term. Liquidity management and the structuring of the

balance sheet from a liquidity point of view are built on three fundamental perspectives: (i) the structural liquidity perspective, which assesses the relationship between stable funding and less liquid assets; (ii) the bank's tolerance for short-term stress such as disruptions in the wholesale and interbank funding markets (wholesale funding dependence); and, (iii) the bank's tolerance to a severe stress scenario wherein, in addition to a funding market shutdown, the bank experiences a substantial outflow of deposits. The three perspectives are summarised in the simplified balance sheet.

In addition to the above approaches of looking at liquidity, there are several targets that SEB

strives to meet, including a diversified funding base, wholesale funding maturities that are well distributed over time, sufficient over-collateralisation in the bank's cover pools and to make sure that the level of encumbered assets is acceptable to unsecured creditors.

The liquidity risk is managed through the limits set by the Board, which are further allocated by the *Group Risk Committee* (GRC). Liquidity limits are set for the group, branches and specific legal entities, as well as for exposures in different currencies.

The risk organisation measures and follows up the liquidity risk and limit utilisation daily, which is reported to management. Risk utilisation based on different market conditions and liquidity stress tests are analysed continuously and reported at least monthly to the GRC and the *Risk and Capital Committee* (RCC).

complements the ICAAP. The assessment is governed by the treasury function with input from the risk and finance organisations. The process is designed to identify possible gaps against SEB's long-term desired level of liquidity adequacy, considering that effective liquidity management is an ongoing improvement process.

Measurement of liquidity risk

The risk organisation is responsible for the liquidity risk measurement methods and metrics applied within SEB. In order to quantify and manage short- and long-term liquidity risk, a range of customised methods and metrics are used to assess the structure of the balance sheet and cash flows under both normal and stressed market conditions. Liquidity gaps shall be identified through measurement of cumulative net cash flows arising from the assets, liabilities and off-balance sheet positions in various time buckets.

Structural liquidity risk

To maintain a sound structural liquidity position, the structure of the liability side should be based on the composition of assets. The more long-term lending and other illiquid assets, the more stable funding is required. This risk is measured by the regulatory defined Net Stable Funding Ratio (NSFR). In this ratio, the amount of available stable funding is put in relation to the amount of required stable funding. At year-end 2024, the NSFR ratio was 111 per cent (112).

Balance sheet structure illustrative

Liquid assets

To mitigate liquidity risk and to ensure that SEB can meet its payment obligations, SEB holds liquid assets that are managed by the treasury function. SEB's weighted High Quality Liquid Assets amounted to SEK 673bn (739) at the end of 2024.

→ For details on the liquid assets, please see SEB's Annual Report, note 39.

Internal liquidity adequacy assessment process

Liquidity risk is not primarily mitigated by capital. However, there are strong links between a bank's capital and liquidity position. Hence, an internal liquidity adequacy assessment process (ILAAP)

Wholesale funding dependence

One way of measuring the resilience for deteriorating market conditions is to assess the time that SEB's liquid assets would last if the wholesale and interbank funding markets are unavailable. This measure, the maturing funding ratio, captures the bank's liquid assets in relation to wholesale funding (issued debt securities) and net interbank borrowings that come to maturity over the coming months, or as the number of months it would take to deplete the liquid assets in a scenario where all maturing funding must be repaid from liquid assets.

Wholesale funding dependence is also measured as the loan to deposit ratio, excluding repos and reclassified debt securities. At year-end 2024, SEB's loan to deposit ratio amounted to 118 per cent (121).

Stressed survival horizon

Severe stress can be modelled by combining assumptions of a wholesale funding market shut-down with assumptions of deposit outflows and drawdowns on commitments, etc. The outcome is captured by the regulatory defined Liquidity Coverage Ratio (LCR) where, in a stressed scenario, modelled net outflows during a 30-day period are related to the amount of total liquid assets. The LCR requirement for total currencies, EUR and USD is 100 per cent while for SEK and other significant currencies the requirement is 75 per cent.

SEB also measures the time it would take for the liquid assets to be depleted in an internally defined severely stressed scenario, expressed as the stressed survival horizon (SSH). The same scenario is also used for monitoring the outcome in the currency dimension. This to discover potential mismatches and dependencies towards the FX-swap market. In addition, SEB monitors various rating agencies' survival metrics.

1) Remapping of deposits between reporting categories.

Table 40. EU LIQB on qualitative information on LCR, which complements template EU LIQ1 in accordance with Article 451a(2) CRR

31 Dec 2024

Explanations on the main drivers of LCR results and the evolution of the contribution of inputs to the LCR's calculation over time

SEB shall at all times have an adequate liquidity buffer to meet the Net Liquidity Outflows. SEB holds HQLA that can be converted into cash to meet liquidity needs for a 30 calendar-day liquidity stress scenario. SEB reviews and potentially adjusts the liquidity buffer reflecting inter alia net outflows which may vary over time.

Explanations on the changes in the LCR over time

The LCR was stable in the quarter. The primary factors influencing the LCR include the issuance and maturities of wholesale funding and the development of deposits. Liquid assets are managed, facilitated through both deposits and wholesale funding, to meet the development in these main drivers. SEB aims to maintain a balanced maturity profile, thereby contributing to a stable LCR over time.

Explanations on the actual concentration of funding sources

Group Treasury continuously manages the short- and long-term funding activities of SEB Group in order to secure sufficient funding diversification. The funding sources are diversified by e.g. product, currency, geography and type of market.

The distribution of funding sources has not changed significantly in the quarter.

High-level description of the composition of the institution's liquidity buffer

The main part of SEB's liquidity buffer is composed of Level 1 assets. A large share is held as cash and central bank reserves, but the liquidity reserve also consists of highly rated sovereign bonds and extremely high-quality covered bonds. A minor part of the liquidity buffer is held in Level 2 assets. Securities within the liquidity buffer should be eligible as collateral at a central bank.

Derivative exposures and potential collateral calls

Derivative exposures and collateral calls are monitored at all times. Potential outflows from the impact of an adverse market scenario is calculated using the Historical lookback approach.

Currency mismatch in the LCR

SEB has LCR requirements in all main currencies (SEK, EUR and USD), hence the currency distribution of the LCR is closely monitored and no major mismatches exist.

Other items in the LCR calculation that are not captured in the LCR disclosure template but that the institution considers relevant for its liquidity profile.

There are no such items identified.

Qualitative information on LCR

SEB shall always have an adequate liquidity buffer to meet the Net Liquidity Outflows as defined in the Liquidity Coverage Ratio (LCR). In addition to central bank reserves, SEB holds High Quality Liquid Assets (HQLA) that can be mobilised to meet liquidity needs during a 30-calendar day liquidity stress scenario.

SEB reviews and potentially adjusts the liquidity buffer reflecting inter alia net outflows which may vary over time.

The treasury function continuously manages the short- and long-term funding activities of the group to secure sufficient funding diversification. The funding sources are diversified by e.g. product, currency, geography and type of market.

The main part of SEB's liquidity buffer is composed of Level 1 assets. A large share is held as central bank reserves, but it also consists of highly rated sovereign bonds and extremely high-quality covered bonds. A minor part of the liquidity buffer is held in Level 2 assets. All securities within the liquidity buffer should always be eligible as collateral in a central bank as defined in the CRR.

SEB has LCR requirements in all main currencies (SEK, EUR and USD), hence the currency distribution of the LCR is closely monitored and no major mismatches exist. Additionally, derivative exposures and collateral calls are always monitored.

The LCR was stable during the year. Net outflows increased following an increase of customer deposits. The average duration on wholesale funding decreased which also contributed to an increase in Net outflows. HQLA increased, driven by an increase in withdrawable central bank reserves.

The distribution of funding sources has not changed significantly during the year.

Table 41. EU LIQ2 – Net Stable Funding Ratio

COMMENT

- NSFR has been stable during the last six months. Comparing 31 December 2024 with 30 June 2024, the ratio has decreased from 112% to 111%. During the period, there have been no significant changes in neither ASF nor RSF.

Asset encumbrance

EU AE4 – Accompanying narrative information

The primary source of asset encumbrance in SEB is the issuance of covered bonds, which is a funding source used to fund residential mortgages. The overcollateralisation for covered bonds in the tables below represents the 2 per cent regulatory required overcollateralisation. The bank also has voluntary overcollateralisation additional to the statutory requirement of 2 per cent to be able to withstand a significant property price fall caused by a disruption in the real estate market.

Furthermore, asset encumbrance is also driven by client facilitation within the Markets business, where secured financing transactions, such as repos and securities lending and borrowings, give rise to the need for collateral both on and off the balance sheet. Other sources of asset encumbrance include collateral management and derivatives. Unencumbered other assets include assets

such as intangible assets and derivatives.

The majority of encumbered assets and collateral are derived from the parent company, and there is no significant intragroup encumbrance. The largest original currency of encumbered assets and collateral, as well as source of encumbrance, is SEK followed by EUR and USD.

In below tables, an asset is treated as encumbered if it has been pledged or if it is subject to any form of arrangement to secure, collateralise or credit enhance any transaction from which it cannot be freely withdrawn. In the Annual Report on the other hand, only pledged and transferred assets are recognised as encumbered, except for covered bonds.

Amounts are median values based on end of period carrying amounts of asset encumbrance reporting for each of the latest four quarters and are determined by interpolation. The medians disclosed in 'Total rows' are medians of the sums.

Other risks

Insurance risk

Insurance risk in SEB consists of all risks related to the group's life insurance operations; unit-linked, traditional life and risk insurance. The main risks include market risk and underwriting risk.

SEB's life insurance operations are conducted within the SEB Life Group. Unit-linked products represent the majority of the business. In 2016, SEB re-opened sales within traditional life insurance in Sweden, after having been closed since 2007. SEB also offers insurance policies in Ireland and the Baltic countries.

The SEB Life Group is exposed to market risks through the investments linked to traditional life insurance policies with guaranteed benefits and risk insurance operations at each subsidiary, as well as through investments of own equity. The traditional insurance business generates a majority of the market risk, driven by the risk of losses on traditional life insurance policies with guaranteed benefits due to changes in fair value of assets and liabilities. Such changes in fair value can be caused by changes in interest rates, credit spreads, equity prices, property prices, exchange rates and implied volatilities.

In the unit-linked insurance products, the market risk is borne by the policyholder. However, SEB has an indirect exposure to market risk through the policyholders' investments, since a part of the future income stream is based on the value of the assets under management.

Underwriting risk pertains to the risk of loss or of negative changes in the value of insurance liabilities (technical provisions) due to inadequate pricing and/or provisioning assumptions. It includes factors such as mortality, longevity, disability/morbidity (including risks that result from fluctuation

in the timing and amount of claim settlements), catastrophe risk (e.g., extreme or irregular events), expense risk and lapse risk (i.e., policyholder behaviour risk).

Risk management and measurement

Market risk in the traditional life insurance products with guaranteed returns can be mitigated through standard market risk hedging schemes and monitored through asset/liability management (ALM) risk measures and stress tests. This is supplemented by market risk tools such as VaR and scenario analysis. In the traditional products, the difference between asset values and the guaranteed obligations constitutes a buffer against profit and loss volatility.

Underwriting risks are controlled through the use of actuarial analysis and stress tests of the existing insurance portfolio. Mortality and disability/morbidity risks are usually reinsured for large individual claims or for several claims attributable to the same event. Underwriting risk parameters are validated annually. Policyholders within certain traditional life insurance products are free to transfer/surrender their policies from SEB. The utilisation of this option has been very low historically. Nevertheless, to safeguard against unplanned cash outflows sufficient liquid investments are maintained. Regular cash flow analysis is conducted to mitigate this risk.

The profitability of existing and new business is closely monitored, and look-through of funds is implemented to the extent possible for better calculation of capital requirements under the Solvency II regime.

The risk organisation is responsible for measuring, monitoring and reporting the risks inherent in

SEB's life insurance operations. Measurement and monitoring are performed on a regular basis for each insurance company. Solvency capitalisation calculations, in line with the standard formula in the Solvency II regulatory framework, are performed at least quarterly and the required reporting is submitted to the financial supervisors on a quarterly basis. Solvency figures are closely monitored over time. Key risks are reported to the *Group Risk Committee* (GRC), the *Risk and Capital Committee* (RCC) and to the boards of each insurance company.

Solvency II

Solvency II is the regulatory framework for the governance, internal control and capital requirements for insurance companies across Europe. The regulation facilitates transparency and comparability, and ensures companies' ability to meet their obligations and thus increase protection for policyholders. Under Solvency II, all risks are taken into account, including market risk, underwriting risk and operational risk. Stress testing is applied to assess the company's resilience to sudden changes in assets and liabilities.

Pension risk

Pension risk is the risk that allocated funds for defined benefit pension plans should prove insufficient to meet future payments. The risk related to the group's pension plan is in some ways comparable in nature to the risk of traditional life insurance products and is measured in a similar way. However, the pension obligations are defined and therefore not depending on the earnings of the pension foundation. This means that pension risk resides with the employer in the respect that if

future payments are not fully covered by the allocated funds in the pension foundation, the payments would have to be made by the SEB Group. The risk organisation regularly monitors and reports on the risk development of the pension foundations and pension obligations to the GRC and the Board's RCC.

Business, strategic and reputational risks

Business risk is the risk of lower earnings than expected, due to reduced volumes or price pressure combined with inability to offset the revenue decline with a reduction in costs.

Strategic risk is the risk of loss due to adverse business decisions, improper implementation of decisions, or lack of responsiveness to changes in the business environment. The risk is related to business risk, but often arises through long-term structural factors.

Reputational risk is the risk arising from negative perception on the part of customers, counterparties, shareholders, investors, debt-holders, market analysts, other relevant parties or regulators that can adversely affect SEB's ability to maintain existing, or establish new, business relationships or funding.

SEB continuously works to mitigate business, strategic and reputational risks, for example through strategic business planning and business reviews, proactive cost management, an agile IT development approach, and an ambitious corporate sustainability agenda.

Capital management and own funds

The group's capital management seeks to balance shareholders' demand for return with the financial stability requirements of regulators, debt investors, business counterparties and other market participants, including rating agencies.

Capital management

Governance

The capital policy defines how SEB's capital management should support its business goals, the group's dividend policy and rating targets. The capital policy, which is reviewed yearly, is established by the Board of Directors based on recommendations from the *Risk and Capital Committee* (RCC).

The group's CFO is responsible for the process of assessing the capital requirements in relation to the group's risk profile and for proposing a strategy for maintaining the capital levels. This process, the internal capital adequacy assessment process (ICAAP), is integrated with the group's business planning and is part of the internal governance framework and internal control systems.

Capital management

In the capital plan, SEB considers internal views on material risks and their development as well as risk measurement models, risk governance and risk mitigants. It is linked to the overall business planning and establishes a strategy for maintaining appropriate capital levels. Together with continuous monitoring and reporting of the capital adequacy to the Board, this ensures that the relationship between shareholders' equity, economic capital, regulatory and rating-based requirements are managed so that the survival of the group is not jeopardised.

SEB's capital plan covers the strategic planning horizon and projects economic and legal capital requirements, as well as available capital resources and relevant ratios including risk-based and non-risk-based metrics such as the leverage ratio. It is

forward-looking, taking into account current and planned business volumes. The capital plan is stress tested for potential down-turns in the macroeconomic environment, strategic risk factors identified in the business planning, and other relevant scenarios. The capital plan is established annually and updated if needed during the year. SEB's capital is managed centrally, pursuant to an internal framework in accordance with local requirements as regards statutory and internal capital.

The ICAAP is used as input to the regulatory supervisors to annually assess SEB in accordance with the parameters of the Supervisory Review and Evaluation Process (SREP), including the bank's capital adequacy, risk measurement models and risk governance, among other things. The Swedish FSA concluded in its latest SREP that SEB is sufficiently capitalised and adequately measures and manages its risks.

Regulatory capital requirements

On 29 December 2020 new capital requirements started to apply for Swedish banks, since the EU Banking package was transposed into Swedish law. CET 1 capital requirements consist of four main parts:

1. A Pillar 1 minimum requirement of 4.5 per cent
2. Pillar 2 requirements (P2R)
3. A combined buffer requirement and
4. A Pillar 2 guidance (P2G).

The Pillar 2 requirement (P2R) for SEB consists of credit related concentration risk, interest rate risk in the banking book and a temporary add-on for the

ongoing review of IRB models. According to the 2024 SREP decision, the CET1 capital requirement for P2R risk was 1.5 per cent of REA for SEB.

The combined buffer requirement consists of a capital conservation buffer of 2.5 per cent, the buffer of 1 per cent for other systemically important institutions (O-SII buffer), the systemic risk buffer of 3.1 per cent and the countercyclical buffer. The countercyclical buffer rate for Swedish exposures was kept at 2.0 per cent, which is the neutral level of the buffer.

Through the Pillar 2 Guidance (P2G), the Swedish FSA informs a bank which capital level it expects the bank to hold over and above the capital requirement while the P2R and the combined buffer requirement is applied to cover risks and

manage future financial stresses. The Swedish FSA decided that the P2G, to be fully met with CET1 capital, should be 0.5 per cent of REA for SEB, i.e. unchanged compared with the corresponding decision in the previous year. SEB's applicable CET1 capital requirement and P2G as at year-end was approximately 14.7 per cent (14.7).

Furthermore, the leverage ratio P2G was decided to be 0.5 per cent (0.5) of the leverage exposure – on top of the minimum 3 per cent requirement for the leverage ratio. At the end of the year, SEB's leverage ratio was 5.4 per cent (5.4). The components of the risk-based capital requirements for SEB as at year-end 2024 are illustrated in the table below.

Table 45. Regulatory capital requirement

SEB Consolidated situation – Prudential requirements (explicit or implicit) Dec 2024 ¹⁾				
	CET1	AT1	Tier 2	Total
Pillar 1	4.5%	1.5%	2.0%	8.0%

Pillar 2 Guidance (P2G)	0.5%			0.5%
Overall capital requirement and P2G	14.7%	1.7%	2.5%	18.9%

1) According to 2024 SREP decision.

Capitalisation target

The Board of Directors sets SEB's capitalisation target to ensure that the group's capital is sufficient both to support its business strategy and risk tolerance and to safeguard that the group can maintain its capital ratios above regulatory requirements also in less favourable economic conditions. SEB aims to have a buffer of 100 to 300 basis points above the capital requirement. The buffer shall cover sensitivity to currency fluctuations in REA, changes in the net value of the Swedish defined benefit pension plan as well as general macroeconomic uncertainties. With a CET1 capital ratio of 17.6 per cent as at year end 2024, the buffer is 290 basis points above the regulatory requirements and P2G.

Economic capital

SEB uses an economic capital model to internally assess the capital requirement of the group. The model is similar to the Basel III rules for capital adequacy in that many of the underlying risk components are the same. However, it is not fully comparable with the estimated capital requirement published by the Swedish FSA due to differences in assumptions and methodologies. The economic capital is calculated with a one-year horizon and based on a confidence level of 99.97 per cent, which is equivalent to the capital requirement for a very high debt credit rating. The shareholders' equity and other financial resources which can absorb unexpected losses are referred to as available capital.

Capital allocation and business equity

In addition to ensuring that SEB has an adequate capital buffer, the capital management also ensures that the capital is used where it can generate

the best risk-adjusted returns. The group's capital is managed centrally, meeting also local requirements as regards statutory and internal capital. A clear governance process is in place for capital injections from the parent bank to the subsidiaries. SEB employs an internal capital allocation framework for measuring risk and profitability. The basis for this framework, called business equity, is derived from regulatory capital requirements and is calibrated with SEB's capital targets. The business equity framework allocates the total level of equity needed to maintain a desired capital adequacy to the business units in proportion to risks undertaken. Thus, business equity is a risk measure, since individual transactions are allocated business equity in proportion to their risks.

Stress testing

SEB views the macroeconomic environment as the major driver of risk to the group's earnings and financial stability. To arrive at an appropriate and comprehensive assessment of the bank's financial strength, both the expected development of the economy as well as stressed scenarios representing more severe conditions are taken into consideration. Stress testing is used to assess an extra safety margin over and above the formal capital model requirements, covering, for example, the potential of a sharp decline in the macroeconomic environment.

Using recession scenarios and contrasting them to the base scenario of the financial plan, the stress testing framework projects the risk level in relation to the available capital resources. In the stressed scenarios, projected earnings for future years are lower, credit losses increase, and average risk weights in credit portfolios increase due to negative risk class migration. The stress testing

SEB's stress testing framework covers all main risk types:

Credit risk Key economic criteria from recession scenarios are correlated with historical observed default data used in the average through-the-cycle credit models. In the stressed scenarios, credit losses increase and average risk weights are impacted by worsening risk classes due to assumed risk class migrations. Both internal and external default and loss data are used together with historical and scenario macroeconomic data to predict the effect on the bank's existing credit portfolio considering default rates and loss levels by country and by portfolio. In this way, the sensitivity of different parts of the portfolio can be identified, enabling the bank to manage risk more effectively. The concentration to large exposures is also stressed by simulating the effect of a default by one or more of these despite their investment grade rating.

Market risk SEB uses both historical and forward-looking scenarios to stress test its portfolios. The scenarios are reviewed regularly and are part of SEB's market risk tolerance framework. The stress tests cover the main risk factors relevant to SEB's portfolios.

Operational risk Key economic criteria from recession scenarios are correlated with historically observed operational losses both in SEB and externally to produce an expected loss for each adverse scenario. Idiosyncratic, highly unlikely scenarios, e.g., a rogue trader event, are also run as special cases to contrast their effect both during mild and severe recessions.

Funding and business risk Key economic criteria from recession scenarios are correlated with historically observed trading and fee income levels together with projections of likely costs. Net interest income levels are estimated using the scenario interest rate and credit spread data. Overall, the result in most scenarios is a reduction of operating profit before credit, market and operational risk losses.

framework uses historical experience (such as the Swedish banking crisis in the early 1990's and the financial crisis in 2008) and internal statistics to calibrate the level of stress that the base scenario should be exposed to.

SEB typically works with different stress test scenarios designed to reflect both probable and hypothetical scenarios. The probable scenarios have a sufficient connection with historical observation to enable calculation of the likely effect, whereas the hypothetical scenarios represent tail events where historical data is scarce or not available. Care is taken to ensure that the economic parameters fit with each other. A full stress test contains a number of scenarios where more probable outcomes for certain parameters are combined with

hypothetical events for other parameters. Performing this kind of stress testing constitutes an important part of SEB's process for capital assessment over the long-term planning horizon. Available and required capital is computed, contingent on the stressed environment, for each year in the scenarios. This makes it possible to assess SEB's financial strength under even more adverse conditions than those assumed in financial plans.

Finalisation of the Basel III framework

In December 2017, the Basel Committee presented the framework for revisions to the Basel III framework (also referred to as Basel IV) with the objective of the framework is to reduce excessive variability of risk-weighted assets (RWA) among banks. For that purpose, the Committee proposed an output floor implying that RWA calculated by applying internal models cannot in aggregate fall below 72.5 per cent of RWA calculated by the standardised approaches.

The Basel IV framework has now been implemented into EU-legislation and is applicable for banks as at January 1, 2025. The implementation will have a five-year gradual phase-in of the so-called output floor, which will then reach its steady state calibration of 72.5 per cent by 1 January 2030. For the purpose of output floor calculations unrated investment grade corporates will receive a risk weight of 65 per cent instead of 100 per cent until December 31, 2032. The implementation of the Basel IV framework in the US as well as in the UK has been delayed. The EU has, due to the delayed implementation in the US, postponed by one year the implementation of the market risk parts (FRTB) of Basel IV framework. The internal models for operational risk are replaced by standardised methods on 1 January 2025.

Own funds and capital requirements

Table 46. EU OV1 – Overview of risk weighted exposure amounts

SEK m		a		b	c
		Risk weighted exposure amounts (RWEAs)		30 Sep 2024	Total own funds requirements
		31 Dec 2024	30 Sep 2024		31 Dec 2024
1	Credit risk (excluding CCR)	825,328	805,652		66,026
2	of which the standardised approach	89,147	89,549		7,132
3	of which the Foundation IRB (F-IRB) approach	211,931	210,056		16,955
5	of which the Advanced IRB (A-IRB) approach	360,991	352,989		28,879
6	Counterparty credit risk – CCR	32,995	32,576		2,640
7	of which the standardised approach	5,531	5,857		442
8	of which internal model method (IMM)	16,180	14,790		1,294
EU 8a	of which exposures to a CCP	705	757		56
EU 8b	of which credit valuation adjustment – CVA	5,461	6,013		437
9	of which other CCR	5,118	5,159		409
15	Settlement risk	1	2		0
16	Securitisation exposures in the non-trading book (after the cap)	2,819	2,787		226
18	of which SEC-ERBA (including IAA)	2,819	2,787		226
20	Position, foreign exchange and commodities risks (Market risk)	28,359	24,913		2,269
21	of which the standardised approach	7,597	7,115		608
22	of which IMA	20,762	17,798		1,661
EU 22a	Large exposures				
23	Operational risk	58,359	57,696		4,669
EU 23c	of which advanced measurement approach	58,359	57,696		4,669
24	Amounts below the thresholds for deduction (subject to 250% risk weight) (For information)	30,717	29,552		2,457
	Additional risk exposure amount due to Article 458 CRR (For information)	154,121	152,783		12,330
	Additional risk exposure amount due to Article 3 CRR (For information)	9,137	275		731
29	TOTAL	947,860	923,626		75,829

Table 47. EU CR8 – RWEA flow statements of credit risk exposures under the IRB approach

SEK m	a
	Risk weighted exposure amount
1 Risk weighted exposure amount as at the end of the previous reporting period	563,045
2 Asset size (+/–)	8,355
3 Asset quality (+/–)	–9,294
4 Model updates (+/–)	
5 Methodology and policy (+/–)	
6 Acquisitions and disposals (+/–)	
7 Foreign exchange movements (+/–)	10,816
8 Other (+/–)	
9 Risk weighted exposure amount as at the end of the reporting period	572,923

COMMENT

- REA for credit risk under the IRB approach increase by approximately SEK 6bn compared to 30 September 2024. The main driver was FX movements.

Table 48. EU CCR7 – RWEA flow statements of CCR exposures under the IMM

SEK m	a
	RWEA
1 Risk weighted exposure amount as at the end of the previous reporting period	14,807
2 Asset size	814
3 Credit quality of counterparties	75
4 Model updates (IMM only)	
5 Methodology and policy (IMM only)	
6 Acquisitions and disposals	
7 Foreign exchange movements	501
8 Other	
9 Risk weighted exposure amount as at the end of the reporting period	16,196

COMMENT

- REA for counterparty credit risk under the IMM approach increase modestly by approximately SEK 1.4bn compared to 30 September 2024.

Table 49. EU MR2-B – RWEA flow statements of market risk exposures under the IMA

SEK m	a	b	f	g
	VaR	SVaR	Total RWEAs	Total own funds-requirements
1 Risk weighted exposure amount as at the end of the previous quarter	4,745	13,053	17,798	1,424
1a Regulatory adjustment	–3,266	–9,246	–12,512	–1,001
1b RWAs at the previous quarter-end (end of the day)	1,479	3,807	5,286	423
2 Movement in risk levels	–278	335	57	5
3 Model updates/changes	–175		–175	–14
4 Methodology and policy				
5 Acquisitions and disposals				
6 Foreign exchange movements				
7 Other	173	3	176	14
8a RWAs at the end of the reporting period (end of the day)	1,198	4,145	5,343	427
8b Regulatory adjustment	4,742	10,677	15,419	1,234
8 Risk weighted exposure amount as at the end of the reporting period	5,940	14,822	20,762	1,661

COMMENT

- Higher averages for the IMA VaR and SVaR (in contrast to consistently lower results for total trading and liquidity VaR) led to a small uptick in REA.

85	Amount excluded from T2 due to cap (excess over cap after redemptions and maturities)			484 (5), 486 (4) & (5)

COMMENT

- SEB's Common Equity Tier 1 capital ratio decreased to 17.6% in December 2024 compared to 19.0 per cent in June 2024. The change was attributable to higher REA and lower CET1 capital.

Table 53. EU KM2 – Key metrics: MREL and, where applicable, G-SII requirement for own funds and eligible liabilities

SEK m	a	
	31 Dec 2024	30 Jun 2024
	Minimum requirement for own funds and eligible liabilities (MREL)	Minimum requirement for own funds and eligible liabilities (MREL)
Own funds and eligible liabilities, ratios and components		
1 Own funds and eligible liabilities	381,625	395,559
EU-1a of which own funds and subordinated liabilities	306,214	295,957
2 Total risk exposure amount of the resolution group (TREA)	947,860	920,279
3 Own funds and eligible liabilities as a percentage of TREA (row1/row2)	40.3%	43.0%
EU-3a of which own funds and subordinated liabilities	32.3%	32.2%
4 Total exposure measure of the resolution group	3,535,907	4,015,649
5 Own funds and eligible liabilities as percentage of the total exposure measure	10.8%	9.9%
EU-5a of which own funds or subordinated liabilities	8.7%	7.4%

COMMENT

- The minimum requirement for own funds and eligible liabilities (MREL) is met with sufficient own funds (capital) and eligible liabilities in relation to the total capital requirement, meaning TREA and outstanding eligible liabilities are the typical drivers of the ratio.

10 Other	16,079	239,683	77			255,839	5,927	2		5,929	74,111		
11 TOTAL	73,088	2,304,597	3,135		16,819	2,397,639	56,845	62	226	57,133	714,161		

COMMENT

- The main country of residence affecting the buffer rate is Sweden where the buffer rate is 2 per cent, which is the neutral level of the buffer.

Table 57. EU CCyB2 – Amount of institution-specific countercyclical capital buffer

SEK m	a	
	31 Dec 2024	30 Jun 2024
1 Total risk exposure amount	947,860	920,279
2 Institution specific countercyclical capital buffer rate	1.57%	1.57%
3 Institution specific countercyclical capital buffer requirement	14,878	14,423

COMMENT

- Institution specific countercyclical buffer rate for SEB remained stable during the second halfyear and is still at 1.57 per cent in December.

Table 58. EU LR1 – LRSum: Summary reconciliation of accounting assets and leverage ratio exposures

SEK m		a	
		31 Dec 2024	30 Jun 2024
		Applicable amount	Applicable amount
1	Total assets as per published financial statements	3,759,028	4,152,293
2	Adjustment for entities which are consolidated for accounting purposes but are outside the scope of prudential consolidation	–485,992	–466,825
3	(Adjustment for securitised exposures that meet the operational requirements for the recognition of risk transference)		
4	(Adjustment for temporary exemption of exposures to central banks (if applicable))		
5	(Adjustment for fiduciary assets recognised on the balance sheet pursuant to the applicable accounting framework but excluded from the leverage ratio total exposure measure in accordance with point (i) of Article 429a(1) CRR)		
6	Adjustment for regular-way purchases and sales of financial assets subject to trade date accounting		
7	Adjustment for eligible cash pooling transactions	–3,049	–4,631
8	Adjustments for derivative financial instruments	–16,343	24,386
9	Adjustment for securities financing transactions (SFTs)	–14,523	–8,495
10	Adjustment for off-balance sheet items (ie conversion to credit equivalent amounts of off-balance sheet exposures)	434,528	432,447
11	(Adjustment for prudent valuation adjustments and specific and general provisions which have reduced Tier 1 capital)		
EU-11a	(Adjustment for exposures excluded from the leverage ratio total exposure measure in accordance with point (c) of Article 429a(1) CRR)		
EU-11b	(Adjustment for exposures excluded from the leverage ratio total exposure measure in accordance with point (j) of Article 429a(1) CRR)		
12	Other adjustments	–137,743	–113,526
13	TOTAL EXPOSURE MEASURE	3,535,907	4,015,649

COMMENT

- SEB's leverage ratio exposure measure decreased from SEK 4,016bn as at 30 June 2024 to SEK 3,536bn as at 31 December 2024, due to decreased assets in the balance sheet.

Table 59. EU LR2 – LRCom: *Leverage ratio common disclosure*

COMMENT

- SEB monitors and discloses its leverage ratio according to regulatory requirements. SEB must meet a leverage ratio minimum requirement of 3 per cent and on top of that a P2G of 0.5 per cent of the leverage ratio exposure measure. The leverage ratio increased to 5.4 per cent as at 31 December 2024 compared to 4.7 per cent as at 30 June 2024, and the main driver is a decreased leverage ratio exposure measure stemming from decreased assets in the balance sheet.

Table 60. EU LR3 – LRSpl: Split-up of on balance sheet exposures (excluding derivatives, SFTs and exempted exposures)

SEK m		a	
		CRR leverage ratio exposures	
		31 Dec 2024	30 Jun 2024
EU-1	Total on-balance sheet exposures (excluding derivatives, SFTs, and exempted exposures), of which:	2,736,605	3,208,385
EU-2	Trading book exposures	144,513	168,917
EU-3	Banking book exposures, of which:	2,592,092	3,039,468
EU-4	Covered bonds	19,595	18,144
EU-5	Exposures treated as sovereigns	406,426	890,597
EU-6	Exposures to regional governments, MDB, international organisations and PSE not treated as sovereigns		
EU-7	Institutions	146,423	137,924
EU-8	Secured by mortgages of immovable properties	1,080,999	1,069,669
EU-9	Retail exposures	81,811	76,794
EU-10	Corporates	633,803	625,607
EU-11	Exposures in default	5,717	3,562
EU-12	Other exposures (eg equity, securitisations, and other non-credit obligation assets)	217,318	217,171

COMMENT

- Total on balance sheet exposures decreased from SEK 3,208bn as at 30 June 2024 to SEK 2,737bn as at 31 December 2024, mainly due to sovereign exposures which decreased by SEK 484bn.

SEB's consolidated situation

Scope of application of the regulatory framework

The group is comprised by banking, finance, securities and insurance companies. The parent company of the group is Skandinaviska Enskilda Banken AB (publ), corporate registration number 502032-9081. The capital adequacy rules apply to each individual group company that has a license to carry out banking, finance or securities operations as well as to the consolidated group. Group companies that carry out insurance operations have to comply with solvency requirements but are excluded in the capital adequacy.

The tables below show the scope of consolidation and the difference between the accounting and regulatory scopes of consolidation due to the insurance operations.

The consolidated SEB Group must also comply with capital requirements concerning combined banking and insurance groups, i.e. financial conglomerates. The combined capital requirement for the SEB financial conglomerate was SEK 254.8bn (238.2) while the own funds amounted to SEK 297.0bn (276.4). In these total figures, SEB Life and Pension Holding AB has contributed with Solvency II figures from 30 September 2024.

The consolidated SEB Group must also comply with capital requirements concerning combined banking and insurance groups, i.e. financial conglomerates. The combined capital requirement for the SEB financial conglomerate was SEK 254.8bn (238.2) while the own funds amounted to SEK 297.0bn (276.4). In these total figures, SEB Life and Pension Holding AB has contributed with Solvency II figures from 30 September 2024.

Remuneration

SEB's remuneration principles, governance- and remuneration structures are laid out in the Remuneration Policy. The Remuneration Policy stipulates that remuneration shall be aligned with the bank's strategy, goals, values and long-term interests and ensure that conflicts of interest are avoided. This shall build value for both SEB and the shareholders while promoting the best interest of the customers, encourage high performance, and risk-taking that is aligned with the risk tolerance level set by the Board of Directors, and sound and responsible behaviour based on SEB's values. These objectives are applicable to all employees.

→ For further information about SEB's remuneration structure and systems, including description of the governance model relating to remuneration as well as the responsibility of RemCo, please refer to the Annual Report, Board Committees and Remuneration sections in the Report of Directors and note 8.

Remuneration Policy

The Remuneration Policy is adopted each year by the Board, based on a proposal by the Remuneration and Human Resource Committee of the Board (RemCo). The proposal is preceded by a risk analysis involving relevant control functions. The risk analysis is also reviewed and approved by the *Risk and Capital Committee* (RCC). The RemCo is also responsible for following up and evaluating the adopted remuneration and incentive programmes as well as to yearly receive a review of SEB's adherence to the Remuneration Policy, performed by Group Internal Audit.

The Remuneration Policy is applicable to all employees, in all geographies, within the group, including staff that has a material impact on the risk profile of the bank (Identified staff). Subsidiaries have specific remuneration policies that are aligned with the group's Remuneration Policy but, where relevant, take into account and are aligned with sector specific regulations.

Senior managers, other key employees and employees in certain business units where it is standard market practice, are offered individual variable remuneration. SEB utilises both deferred and non-deferred as well as collective- and individual variable remuneration models. Variable remuneration is a means to drive and reward performance and behaviours to create long-term shareholder value. Moreover, it is also an essential way of securing flexibility in the remuneration cost. Equity-based remuneration is a mean to attract and retain employees with key competence. It also provides an incentive for employees to be shareholders of SEB which promotes long-term commitment that is aligned with the shareholders' interests.

In 2024, the Remuneration Policy was updated to codify the sustainability targets used in the profit-sharing program, the All Employee Programme and to include thresholds for allocation of cash based variable remuneration under the Investment Firm Directive. The update in the Policy will not lead to any changes on how SEB operates its remuneration models, levels or deferral structure.

For Identified staff, the Remuneration Policy stipulates a maximum level of variable remuneration that may not exceed 100 per cent of the fixed remuneration.

The Remuneration Policy sets out the different

categories of Identified staff. The categorisation is based on the risk analysis of the remuneration structures prepared by the control functions. The following categories are used to determine which positions are Identified staff:

1. Members of the Board and Group Executive Committee
2. Senior Management
3. Heads of material business areas/units
4. Responsible persons within Group Control functions
5. Heads of Legal department and support functions
6. Employees with mandate to take decisions that materially affect the risk position of the bank
7. Members of New Product Approval Committees.

The Remuneration Policy furthermore stipulates that control functions should be remunerated independently of the business they oversee. This is achieved by ensuring that final determinations of remuneration for employees within control functions are not made in the business units they oversee. As a general rule, employees within the control functions may normally not participate in individual variable remuneration programmes.

For all staff, including Identified staff, guaran-

teed variable remuneration shall be awarded and paid in line with the remuneration structure and provisions of the applicable unit and position and is limited to the first performance year of employment.

Redundancy payments shall follow the requirements in local labour law and/or collective bargaining agreements, as applicable, and shall mirror the employee's performance, employment period and cannot reward failure or misconduct. Any variable remuneration paid in connection to the termination of employment shall reflect the employee's performance and shall not promote excessive risk-taking.

All variable remuneration is based on SEB's Risk Adjusted Performance Measurement (RAPM) model derived from SEB's business steering model, the Business Equity model, used to distribute equity to the divisions. The model takes into account the cost of liquidity and establishes the risk adjusted result, by deducting the cost of equity from the gross result, which sets the foundations for any variable remuneration.

Individual variable remuneration is determined based on SEB's, the relevant business area's/ business unit's/team's and the individual's performance. SEB's and the relevant business area's/ business unit's/team's performance is measured using specific targets and key indicators defined in

the respective business plans. The specific targets vary between years and is a combination of financial and non-financial targets such as customer satisfaction or targets relating to sustainability. Individual performance is evaluated according to an appropriate balance between quantitative and qualitative, including financial and non-financial, measures within SEB's target areas derived from the applicable business. The criteria are evaluated in different ways. On group and divisional/unit level, the financial result in terms of Operating cost, Operating profit, Return on Equity (RoE), Return on Business Equity (RoBE) and the risk adjusted result are followed up. The non-financial targets include for example ESG targets and criteria

relating to compliance with external and internal regulations and policies. Ultimately, the determination is based on an overall assessment with a balanced, non-formulaic but stringent and strongly governed approach to the final allocation.

SEB always apply deferrals on individual variable remuneration above certain thresholds for both Identified staff and non-identified staff. The deferral levels for Identified staff are aligned with the relevant regulations were at least 40 per cent of the total variable remuneration shall be deferred and subject to risk adjustment and malus conditions. For senior management and employees receiving high level of variable remuneration, the deferral level shall be at least 60 per cent.

In addition, at least 50 per cent of the total variable remuneration, i.e. both the deferred and non-deferred variable remuneration, shall be allocated in SEB shares or equivalent equity-based instruments or, were relevant, in fund units of the funds managed. All equity allotments, i.e. both the deferred and non-deferred part, shall have a one-year mandatory holding period. Equity deferrals will be allotted in form of LTI programmes and paid out according to its programme structure and terms and conditions. The length of equity deferrals (may be paid pro-rata) subject to risk adjustment before pay-out, is at least four years for Identified staff and for senior management at least five years. A further requirement for vesting

for members of the *Group Executive Committee* (GEC) is that they hold shares in SEB equivalent to one-year salary net of taxes, acquired no later than on a pro-rata basis during the initial three-year vesting period.

Deferred variable remuneration is subject to ex-post risk adjustment. SEB applies certain criteria for risk adjustments at group, division/business area/business unit and individual levels respectively, that includes restatement of SEB's financial statements, significant failure of risk management that negatively impacts the financial result or compliance breaches.

ESG risk

SEB has the ambition to accelerate progress towards a sustainable future for people, environment, and the economy. One part of that is managing ESG risks and building resilience in the face of a changing world. Throughout the year, SEB has continued to enhance ESG risk management capabilities, especially addressing climate-related risks.

Business strategy and processes

Sustainability strategy – facilitating transition and supporting resilience

SEB's overall 2030 Strategy includes the following strategic focus areas: acceleration of efforts, strategic change, strategic partnerships and efficiency improvements. The overarching aim is to future-proof the business in terms of customer relationships, profit generation, and banking platform.

Sustainability considerations are relevant within all these areas to various degrees. For example, SEB is accelerating its sustainable financing efforts, establishing strategic partnerships to ensure security standards and data protection, and collaborating with regulators and industry to combat financial crime. SEB's sustainability strategy is a cornerstone of 2030 Strategy and aims at supporting the prioritisation of its efforts to accelerate the transition towards a sustainable future.

SEB's sustainability strategy is built on the bank's purpose: *We exist to positively shape the future with responsible advice and capital. Today and for generations to come.* Among other things, the strategy sets the framework for SEB's role in the sustainability transition. Its purpose is to integrate sustainability considerations into relevant business decisions and, by that, to support the customers.

The sustainability strategy includes four cornerstones related to sustainability matters:

- Providing transition advice, financing and investments

- Innovating and setting standards
- Transforming our business
- Acting as a responsible corporate citizen for a resilient and inclusive society.

The skills, engagement, safety, and ethics of the employees are central to the execution of SEB's strategy. The bank works actively to ensure that

the employees have the best working environment and continuous learning opportunities to support the customers with responsible advice and capital.

Sustainability-related ambitions and targets

To support the sustainability strategy, SEB has set a number of sustainability-related ambitions

and targets. Most of them are related to climate change mitigation, due to the urgent need for transition within this area.

SEB has joined the UN Principles for Responsible Banking, with the purpose to align the business strategy with the Paris Agreement and the UN's Sustainable Development Goals. Additionally, the

Overview of SEB's sustainability-related ambitions and targets

Topical ESRS	Description	Outcome 2024	Outcome 2023	Target 2030
Environmental	Carbon Exposure Index – Fossil fuel credit exposure in our energy portfolio (index=100, 2019)	Index 47	Index 62 ¹⁾	Reduce by 45–60%
	Sustainability Activity Index – Activities supporting the sustainable transition (index=100, 2021)	Index 275	Index 222 ²⁾	Increase 6–8 times
	Financed emissions ³⁾			
	2030 sector targets (NZBA):			
	Oil and gas: E&P and refining (mt CO ₂ e)	N/A	–64%	–70%
	Power generation (g CO ₂ e/kWh)	N/A	–35%	–44%
	Steel (t CO ₂ e/t steel)	N/A	3%	–29%
	Shipping – asset financing (g CO ₂ e/t.nautical mile)	N/A	–12%	–41%
	Car manufacturing (g CO ₂ e/km)	N/A	–16%	–62%
	Household mortgages, Sweden (kg CO ₂ e/m ²)	N/A	6%	–30%
	Heavy vehicle manufacturing (% of ZEV ⁴⁾ in new sales)	N/A	0.9%	35%

	Top Senior Management ⁶⁾	53/47%	55/45%	
Governance	Employees that have completed mandatory training, average ⁷⁾	96%	97%	Increase towards 100%

1) The 2019 baseline was restated in 2024, the outcome for previous year has been adjusted accordingly.

2) Index 2023 adjusted due to data quality and process improvements within the sustainability-linked loans and fund area.

3) Calculation is depending on customer reported data, therefore SEB's 2024 reporting is based on 2023 data and reported as outcome in 2023. Outcome is change vs baseline. Heavy vehicle manufacturing is actual outcome. The data disclosed covers the period 1 January to 31 December 2023. Baseline year is 2020, except for Heavy vehicle manufacturing, which was included last year, and Shipping – asset financing included this year, both with 2022 as baseline.

4) Zero Emission Vehicles.

5) Group Executive Committee as per 31 December 2024. Additional members are not included.

6) Top Senior Management defined as GEC+GEC direct reports.

7) SEB global mandatory trainings: Code of Conduct, AML and Counter Terrorist Financing, Fraud Awareness, Security at SEB, GDPR, Sexual Harassment and Sanctions. Includes consultants, excludes employees on leave of absence.

bank has joined other important initiatives, including the Net-Zero Banking Alliance (NZBA), and the Poseidon Principles for shipping.

SEB aims to achieve a net-zero emissions credit portfolio by 2050. To guide the efforts and track progress toward this goal, two proprietary metrics were developed: the Carbon Exposure Index and the Sustainable Activity Index. These indices provide an opportunity for stakeholders to follow SEB progress in reducing fossil fuel exposure and enhancing positive environmental impact.

Aligned with NZBA commitments, the bank has also set net-zero-adjusted targets for several sectors in credit portfolio by 2030. A new NZBA sector target was added in 2024, for the shipping industry.

In addition to the climate-related ambitions and targets, the table highlights targets for two other sustainability topics: our own workforce, and our corporate culture (business conduct). SEB continuously assesses its ambitions and targets in relation to its strategy, business, and stakeholders, and adjusts them when appropriate.

In addition to our ambitions and targets, SEB's sustainability strategy and efforts are based on a number of international agreements, frameworks and business-related commitments such as UN's Sustainable Development Goals (SDGs), the Paris Agreement, the Universal Declaration of Human Rights, the eight ILO Core Conventions on Labour Standards, the UN Guiding Principles on Business and Human Rights, UN Guiding Principles on Business and Human Rights, the Children's Rights and Business Principles, OECD Guidelines for Multinational Enterprises.

Additionally, SEB has joined or publicly endorsed a number of business-related commitments including UN Global Compact, UN's Principles for Responsible Banking (PRB), Net-Zero Banking Alliance (NZBA), The Principles for Responsible Investments (PRI), The Net-Zero Asset Managers

initiative (NZAMi), Equator Principles, Poseidon Principles, Responsible Ship Recycling Standards (RSRS).

Alignment with the EU Taxonomy

Green lending in SEB is defined by SEB's Green Bond Framework, which draws on the EU Taxonomy, and respectively offers a structured way to classify and report on green lending and emissions reductions. Thus, the pool of green loans in SEB is closely aligned with the taxonomy's substantial contribution part of the technical screening criteria. Additionally, Green Asset Ratio (GAR) is reported in alignment with the EU Taxonomy, providing the proportion of SEB's portfolio that is Taxonomy-aligned.

Through participation in the EU Platform on Sustainable Finance, the bank has advised customers on the EU Taxonomy for the last three years. Advice includes issues related to the potential role of the EU Taxonomy in financing and investments and how this could impact financing structures and access to financing going forward. When assessing clients' transition plans, Taxonomy-aligned capex (transition investments) provides an important input to the understanding of the credibility and risk of the transition plan.

Governance

Sustainability policy framework

SEB manages sustainability matters through internal policies and instructions. All policies are reviewed annually and updated as needed, and most are published on sebgroupp.com. SEB Group policies apply to all subsidiaries unless it is stated otherwise in the policy. SEB is committed to embedding sustainability into policies across various processes, including customer onboarding and business decisions. ESG risks (referred to as sustainability-related risks in SEB's sustainability statement, 2024) are covered by both sustainabil-

ity policy framework and risk policy framework.

SEB's policies addressing climate impact and implementing the climate change mitigation strategy, are integrated within the sustainability policy framework. The sustainability policy framework plays an essential role in credit risk assessments, ensuring that business decisions align with SEB sustainability standards and related policies. SEB's credit policy requirements mandate adherence to sustainability principles and climate risk assessments, reinforcing an approach to responsible risk management and aligning the bank's credit portfolio accordingly. All policies focus on managing impacts while mitigating reputational and credit risk.

The two thematic policies provide the basis for the work to protect the environment and climate and to respect human rights. They set the positions on specific themes, identify the negative impacts, and state expectations and restrictions on certain corporate behavior. They apply to SEB's whole value chain and cover activities and operations globally.

The sector policies establish SEB's position in the form of restrictions, requirements and expectations on relevant environmental, social and governance topics in sectors with a potential material sustainability impact. The selected sector policies apply to business relationships and address climate change mitigation and where relevant, physical climate risks and climate adaptation for each industry. They also support a shift from non-renewable to renewable energy across SEB's financing and investment activities, with specific transition expectations for renewable alternatives.

The Customer Acceptance Policy represents what SEB considers to be the critical requirements when accepting customers. They complement internal and external rules and aim to further institutionalise and reinforce SEB's sound risk culture. The policy includes principals on environmental, social and governance issues.

SEB's Code of Conduct explicitly states that SEB rejects all forms of discrimination or harassment, and strives to ensure that all employees – regardless of ethnic or national origin, gender, transgender identity or expression, skin colour, faith, religion, citizenship, age, disability, civil status or sexual orientation – are treated with respect and provided with equal opportunities. SEB recognises the importance of an inclusive culture and has a designated inclusion and diversity officer and a separate policy on the topic. SEB also has a code of conduct for suppliers.

SEB is committed to respecting human rights in its own operations in all countries where it operates. SEB's Social and Human Rights Policy addresses forced and compulsory labour, and child labour, while Code of Conduct addresses trafficking. In addition, employees in SEB are covered by local laws, regulations, bargaining agreements and by the commitments as stated in the Social and Human Rights Policy.

Sustainability governance model

SEB's operations are managed, controlled and followed up in accordance with policies and instructions established by the Board and the President. This includes sustainability governance. SEB's sustainability governance model includes clear roles and mandates that cover SEB's impacts, risks and opportunities, including impacts on social well-being, human rights, and other ethical considerations.

The Board has oversight of SEB's work to identify, assess and integrate sustainability-related impacts, risks and opportunities in e.g., its strategy, risk management processes, and policy frameworks. The Board takes a holistic view in their oversight, including decisions on trade-offs considered in the short, medium and long term.

The President and CEO is responsible for the day-to-day management of the activities of SEB, the execution of the sustainability strategy, and

the implementation of the governance structure set by the Board. When implementing the sustainability strategy and throughout decision-making processes, consideration is given to sustainability impacts, risks, opportunities, and the associated trade-offs.

CRO ensures that SEB’s risks are identified, measured, assessed, monitored, managed, mitigated and reported. The responsibility includes ESG-related risks.

Sustainable Banking is a support function responsible for driving and coordinating the overall sustainability agenda in close collaboration with divisions, support and staff functions.

During 2024, the President had five CEO committees at his disposal for the purpose of managing the business operation, of which four are actively involved in sustainability matters.

Group Executive Committee (GEC) is a consultative forum for the President, with the purpose of managing the execution of the overall business strategy in the SEB Group. In 2024, the President adopted, after consultation in GEC, SEB’s Double Materiality Assessment (DMA) in accordance with CSRD.

Group Executive Sustainability Committee (GESC), with the Chief Sustainability Officer (CSO) as vice chair, manages the execution of the sustainability strategy in SEB.

Group Risk Committee (GRC), with the Chief Risk Officer as vice chair, addresses all types of risks in SEB, including sustainability and reputational risks, and evaluates portfolios, products, and customers from a comprehensive risk perspective.

Group Internal Control and Compliance Committee (GICC) addresses and follows up on reports from the control functions Group Internal Audit, Group Compliance and, where relevant, the CRO function, as well as reporting and escalations from the Financial Crime Prevention (FCP) Senior Manager and the Group FCP Committee, and the

Group Data Privacy Committee. GICC also follows up on whistleblowing matters.

To execute on the policies, instructions and decisions by the Board and the President, several decision-making bodies in the divisions, support and staff functions are established. These are responsible for continuously identifying, assessing, controlling, and managing all impacts, risks and opportunities relating to their daily conduct of business. Business units are responsible for ensuring that the activities comply with applicable SEB group-wide policies and instructions and are supported by a clear decision-making hierarchy.

Remuneration policy

The Annual General Meeting has established guidelines for salary and other remuneration for the President and CEO and members of the Group Executive Committee (Guidelines). Remuneration of the President, the Deputy Presidents as well as the other members of the Group Executive Committee (Executives) shall be in line with the Guidelines.

The Guidelines cover base pay, equity-based remuneration, pension benefit and other benefits. No cash-based variable remuneration is paid to the Executives, nor are they eligible for the SEB All Employee Programme.

Sustainability KPI’s are integrated in remuneration for all Executives. SEB’s established sustainability ambitions and goals are part of the criteria for allocation.

Main ambitions and goals linked to climate are the Carbon Exposure Index (fossil credit exposure in our energy portfolio) and financed emissions measured according to our 2030 sector targets.

The evaluation of the President is made in a multi-year perspective without a relative weighting of the different performance criteria, rather an aggregated and holistic evaluation of the performance relative the three-year business plan.

Even though the pay structure is seen as mainly fixed, the actual annual deferred share allocation, but not the final outcome, is linked to certain performance criteria as outlined in SEB’s three-year business plan. 50 per cent of the shares are deferred for a minimum of four years, the remaining part for a minimum of six years.

The performance measures for the President’s remuneration have been selected to deliver SEB’s strategy and to encourage behaviors which are in the long-term interest of SEB. In the selection of performance measures, the strategic objectives and both short- and long-term business priorities for 2024 have been taken into account.

Risk management

ESG risk, particularly climate-related risk, is a systemic risk, and therefore is defined as a risk driver, which materialise and amplify existing risks, such as credit risk, market risk, non-financial risk and li-

quidity risk. Accordingly, the management of ESG risks is integrated into existing processes and governance structure for identifying and assessing, measuring, managing and mitigating, monitoring and reporting risks within SEB.

Definitions of ESG risk, its sub-categories, ESG factors and their risk drivers are described in SEB risk inventory and aligned with the definitions provided by the Regulation (EU) 2024/1623.

During 2024, SEB introduced an annual assessment of ESG risk drivers’ materiality for the financial risk categories: credit, liquidity and market risk, which is integrated and aligned to the overall identification and assessment of material risks. To facilitate the assessment of materiality throughout the organisation and to enable aggregation of risks, a matrix approach, allowing for assessment of both financial impact and probability, has been established. Impact levels are defined in financial terms relative impact on the overall risk profile.

Climate change risk drivers

Risk driver	Potential impact	Horizon
Physical risks linked to climate change adaptation		
Acute weather events (mainly flood-related in northern Europe)	Lower collateral valuations in real estate portfolios and increased default risk in companies with operating facilities in areas with elevated flood risk.	
Changes in chronic weather patterns	Lower collateral values in real estate portfolios. Increased default risk for companies with global supply chains.	
Transition risk linked to climate change mitigation		
Policy and legal	Surge in carbon price affecting the repayment capacity for companies in carbon-intensive sectors.	
Technology	Rapid breakthrough in low-carbon technologies leading to stranded fossil-related assets and thereby impacting both collateral values and default risks for companies in affected sectors (for example, energy, transportation, metals and mining and manufacturing).	
Market	Change in consumer preferences to low-carbon alternatives affecting business models (for example, less air travel, less meat and dairy, energy-efficient housing, energy-efficient appliances).	
Reputation	Increasing litigation against companies with certain environmental issues, culminating in increased costs and reputational damage affecting access to capital and thereby default risk.	

Actual Medium term 1–5 years Long term 5–10 years Very long term >10 years

ESG factors considered for 2024 materiality assessment covered physical incl. environmental, as well as transition, social and governance factors, which were further splint into sub-categories.

While various ESG factors have been found relevant for different risks, climate-related risks, both physical and transition, are assessed as material risk drivers for credit risk within SEB's overall risk management framework. Climate-related physical risks, and the connected adaptation risks, including long term changes in weather patterns, are currently less severe than transition risk for credit customers but are expected to increase over time. The Scenario analyses 2024 table provides examples of how climate-related risks could impact SEB across different time horizons.

Risk management processes and tools

To be effectively managed, risks must be well understood. At SEB, various methods have been implemented as transition path and annual client assessments as well as portfolio and scenario analyses to identify, understand and manage climate risks.

Counterparty transition path assessments

Understanding customers' transition plans and emission reduction ambitions is key for SEB to deliver on 2030 sector targets and in the work to align the strategy to the objectives of the Paris Agreement. For four years, SEB has used a proprietary tool, the Customer Sustainability Classification tool (CSC), to illustrate customers' transition plans and to compare them to the objectives of the Paris Agreement. The CSC tool uses information collected from the customers and sector transition pathways developed by third parties. This results in a classification according to five categories: (i) Sustainable; (ii) Paris-aligned; (iii) Transition; (iv) Gradual change; (v) Status quo.

In addition to supporting customer dialogues on the investment needs, risks, and opportunities, a status quo classification triggers escalation requirements in the annual customer acceptance screening.

In the Baltic division, an additional tool is used to support the assessment of ESG risks and sustainability-related impacts, the ESG scorecard. The scorecard facilitates client dialogues on sustainability issues and ensures consistent collection of quantitative and qualitative information to assess customers environmental and climate-related impact, social and governance practices.

The assessment includes an examination of whether the customer measures emissions under Scope 1, 2, and 3 and whether the company's activities fall under the EU Taxonomy regulation, and a general evaluation of physical and transition risks.

Climate-related risk assessment in the credit process

Industry transformation and ESG risks are integral parts of SEB's credit analysis work and credit granting process. Specific climate transition risk analyses are required for customers in high carbon footprint sectors. The focus is on customers' exposure to climate transition risks, their strategies to mitigate them, and the financial impact associated with implementing their climate strategies. In addition, analyses of climate change adaptation risks related to physical climate change are carried out when deemed purposeful.

Scenario analysis

SEB conducts both transition risk and physical risk scenario analyses for relevant parts of credit portfolio.

Assessing the resilience of SEB's credit portfolio against climate-related risks is a complex task due to the wide range of potential future scenarios and

Scenario analyses of the credit portfolio 2024¹⁾

	2030 sector targets in place	Credit exposure (SEK bn) in scope (YE2024) ²⁾	Potential loss in severe adverse scenario
Transition risk			
Oil and gas	Yes	20	medium
Power generation	Yes	102	low
Steel	Yes	12	negligible
Car manufacturing	Yes	14	negligible
Heavy vehicle manufacturing	Yes	15	negligible
Real estate, Sweden	No	268	negligible
Household mortgages, Sweden	Yes	588	negligible
Household mortgages, Baltics	Yes	91	negligible
Physical risk			
Household mortgages, Sweden	Yes	588	low
Real estate including household mortgages, Baltics	Yes	122	low

1) For scenario analysis to assess transition risks, a scenario spanning a ten-year period is applied.

2) Potential loss as percentage of credit exposure in a severe adverse scenario incl. sharp CO₂ price increases and oil price drops: Medium = 1–5%. Low = 0.1–1%, Negligible = < 0.1%.

the long-term outlook required. These scenarios are evaluated by considering both current exposures to climate risk and forward-looking assessments of potential impacts. The scenarios align with the framework provided by the Network for Greening the Financial System (NGFS) and include pathways with disorderly transitions as well as scenarios where global efforts fall short of limiting significant warming.

Identified transition events that could impact borrower creditworthiness in the short to medium term (0–5 years) include surges in carbon pricing, shifts in technology and changing consumer behaviour. These risks primarily affect corporate clients in sectors with a high carbon footprint. The scenario analysis encompasses industries such as oil and gas, power generation, steel, automotive manufacturing, heavy vehicles, real estate, and household mortgages.

To assess long-term transition risks, SEB applies a delayed-transition scenario where policy actions

are postponed, followed by an abrupt and steep rise in carbon prices over a ten-year horizon. For scenario analysis, however, it is assumed that this price increase will occur within three years, aligning with the average maturity of the bank's loan portfolio.

Physical climate risk assessments have been conducted for Swedish household mortgage and Baltic real estate portfolios. In terms of climate-related hazard identification, the most prominent physical risk in SEB's home markets is related to heavy precipitation (according to the Intergovernmental Panel on Climate Change (IPCC)). Key risks include acute floods, as well as chronic sea-level rise. The impact may materialise mainly on the physical assets taken as collateral but could also impact corporate value chains. The former has been the focus of the physical risk assessments.

The above scenarios illustrate future, low probability but high-impact events. As seen in the table above, based on the scenario analyses to date,

the overall portfolio impact is expected to be limited.

A scenario analysis has not yet been completed for the shipping sector, though added to the 2030 sector targets during 2024.

ESG risk in the stress testing framework and methodology

Assessing the resilience of SEB's credit portfolio against climate-related risks has historically been performed as a sensitivity analysis. During 2024, the measurement of climate-related risks has been integrated into the Group's stress testing framework and methodology.

The methodology is built on transition climate scenario analysis for the material sectors, general macroeconomic assessment based on NGFS scenarios, and impact of physical and transition risks on commercial and residential real estate collaterals. A wide range of potential future scenarios and the long-term outlook is used, with the assumption that climate-related events, encompassing both transition and physical risks, materialise simultaneously with greater severity. The scenarios are evaluated by considering both current exposures to climate risk and forward-looking assessments of potential impacts.

The client and sector level assessment looks at the largest and most impacted clients in the material emission heavy sectors. Bottom-up analysis is performed to understand how climate scenarios are likely to impact the financial- and risk positions of the customer and how that could lead to a downgrade of risk class. The stress on client level is extrapolated to all other incumbents operating in the same emission heavy sectors.

The general macroeconomic assessment considers how the transition towards a carbon neutral economy is likely to impose a drag on the general economic activity due to physical and transition

risk. The general macroeconomic assessment is based on NGFS GDP scenarios, which are used to adjust the adverse macroeconomic scenarios applied to the ICAAP stress tests to reflect the impact on economy from 2025 up until 2050 and beyond. NGFS GDP pathways incorporate the impact from various physical risk hazards like heatwave, floods, cyclones etc, but also transition risk.

Impact of physical and transition risk on collateral values captures the impact of acute and chronic physical risks (flooding due to high precipitation (acute) and/or sea-level rise (chronic)) and the impact of EPCs on the market value of the real estate collaterals.

The climate-related transition and physical risks are primarily incorporated in the stress testing framework through the impact on migrations for customers in carbon intense sectors, where the addition of transition and physical risks imply a higher probability to migrate towards worse risk classes or default. Moreover, the market value of real estate collaterals is stressed to reflect effects of physical risk (i.e. floods) or transition risks (EPCs or stranded assets). The results of the assessment are expected to be volatile over time due to shifts in market sentiments and regulatory policies, the impact from potential actions taken by SEB's customers as well as other risk drivers.

Mitigating activities, limits and restrictions

As ESG factors are drivers of multiple risks, ESG risk is implicitly incorporated into several Risk appetite statements within existing risk categories according to materiality, and currently considered in credit risk and reputational risk related statements. Various mitigating activities and restrictions are implemented to ensure the ESG risk is managed for relevant risk categories.

SEB's climate change mitigation strategy is integrated with the core business goals, prioritising

support for the shift to a low-carbon economy in alignment with the Paris Agreement. A key component of this commitment is the target of net-zero emissions across SEB's portfolio by 2050. In 2024, SEB produced its climate change transition plan for the credit portfolio, which outlines specific steps to reduce financed emissions, which is a driver of climate-related transition risk, in accordance with the guidelines of the Net-Zero Banking Alliance (NZBA). SEB's credit portfolio represents the most significant part of the value chain and the plan sets defined interim targets aimed at aligning lending practices with the Paris Agreement.

To further support the transition, since 2019, SEB has had a cap in absolute terms for credit exposure to the exploration and production of oil and gas and oilfield services segments. Monitoring and reporting of the exposure is conducted quarterly, while the level is revised on an annual basis.

Additionally, by adopting group-wide customer acceptance policy and sustainability sector policies, SEB addresses management of ESG-related reputational risk:

- Customer Acceptance Policy represents what SEB considers to be the critical requirements when accepting customers. Multiple principles draw on ESG aspects, such as transparency, business conduct, credible transition planning, adherence to social and human rights and others.
- Sector policies define sustainability-related restrictions on specific activities, which also covers social and human rights restrictions on sectors including gambling, tobacco, arms and defence. The sector policies set expectations on several governance issues, for example sustainability reporting, anti-corruption policies and tax reporting according to country-by-country principle when relevant.

Data availability, quality and accuracy

During 2024, SEB has continued to improve and develop ESG data platform, which serves as a central repository for internally and externally sourced ESG data. While SEB strives to use the most reliable data sources, the underlying sustainability data used are still characterised by quantitative and qualitative gaps. Inconsistencies are observed in reported data stemming from variations in methodologies as well as in corporate reporting, which impact the comparability and usability of the data.

SEB collects data using third-party vendors supplemented by data collected through own efforts from companies' disclosures. Where applicable, estimates, averages and generalised data can be used.

As companies advance in their sustainability reporting, it is anticipated that the quality and availability of sustainability data will improve over time. As new data sources and reporting standards emerge, the methodologies may be reviewed and updated to ensure accuracy and alignment with best practices.

10	Households	N/A	562,700	kilograms of CO ₂ e/square meter (Scope 1 & 2)	N/A	N/A (see note 10)	N/A (see note 10)

Notes

- The sector alignment metric was 126 grams of CO₂e per kWh of power produced in 2020, which is the baseline year. As per year end 2023, the sector alignment metric decreased by 35 per cent to 82 grams of CO₂e per kWh of power produced. The 2030 target for the sector alignment metric is 70 grams of CO₂e per kWh of power produced (–45 per cent compared to 2020). The distance to IEA NZE2050 has been calculated using the modelled 2030 CO₂e intensity of electricity generation published in the IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report (186 grams of CO₂e per kWh of electricity produced). The IEA metric is not fully comparable with the sector alignment metric as it only includes direct emissions (Scope 1) related to the production of electricity while the sector alignment metric includes Scope 1 and 2 emissions related to the production of electricity, heat and cooling. No interim target has been set for 2025.
- The Fossil fuel combustion sector includes the extraction of oil and gas and refining of petroleum products sectors. The sector alignment metric was 18.5 million tonnes of CO₂e in 2020, which is the baseline year. As per year end 2022, the sector alignment metric decreased by 64 per cent to 6.6 million tonnes of CO₂e. The 2030 target for the sector alignment metric is 5.6 million tonnes of CO₂e (–70 per cent compared to 2020). In the IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report, the emissions from combustion activities related to oil and natural gas decrease by 21 per cent between 2020 and 2030. No interim target has been set for 2025.
- The sector alignment metric was 159 grams of CO₂e per kilometer in 2020, which is the baseline year. As per year end 2023, the sector alignment metric decreased by 16 per cent to 134 grams of CO₂e per kilometer. The 2030 target for the sector alignment metric is 61 grams of CO₂e per kilometer (–62 per cent compared to 2020). The IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report does not include an emission intensity indicator comparable with the sector alignment metric. The IEA Net-Zero scenario assumes that the share of plug-in hybrid, battery and fuel cell electric cars and vans in new sales reaches 67 per cent in 2030. No interim target has been set for 2025.
- No 2030 sector target has been set for the Aviation sector.
- The Maritime sector includes the lending where vessels are used as collateral for our financing. The vessels in scope are the same as those included in the Poseidon Principles reporting. The sector alignment metric was 9.7 grams of CO₂e per tonne capacity transported per nautical mile sailed in 2022, which is the baseline year. As per year end 2023, the sector alignment metric decreased by 12 per cent to 8.5 grams of CO₂e per tonne capacity transported per nautical mile sailed. The 2030 target for the sector alignment metric is 5.7 grams of CO₂e per tonne capacity transported per nautical mile sailed (–41 per cent compared to 2022). The IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report does not include an emission factor comparable with the sector alignment metric. No interim target has been set for 2025. The baseline year for the sector alignment metric is 2022.
- No 2030 sector target has been set for the Cement sector.
- The Iron and steel sector includes the manufacturing of carbon and stainless steel. The sector alignment metric was 1.39 tonne of CO₂e per tonne steel produced in 2020, which is the baseline year. As per year end 2023, the sector alignment metric increased by 3 per cent to 1.43 tonne of CO₂e per tonne steel produced. The 2030 target for the sector alignment metric is 0.98 tonne of CO₂e per tonne steel produced (–29 per cent compared to 2020). The distance to IEA NZE2050 has been calculated using the modelled 2030 CO₂e intensity of steel production published in the IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report (1.07 tonne of CO₂e per tonne steel produced). The IEA metric is not fully comparable with the sector alignment metric as it only includes industrial process emissions (Scope 1) while the sector alignment metric includes Scope 1 and 2 emissions. No interim target has been set for 2025.
- No 2030 sector target has been set for the Chemicals sector.
- The sector alignment metric was 0.5 per cent (share of Zero Emission Vehicles) in 2022, which is the baseline year. As per year end 2023, the sector alignment metric increased by 0.4 percentage points to 0.9 per cent. The 2030 target for the sector alignment metric is 35 per cent. In the IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report, the share of zero emission buses and heavy trucks in new sales reaches circa 35 per cent in 2030. No interim target has been set for 2025. The baseline year for the sector alignment metric is 2022.
- The Household mortgage sector includes the lending related to the Swedish Household mortgage portfolio. The sector alignment metric was 3.6 kilograms of CO₂e per square meter in 2020 (rebased to cater for changes in methodology), which is the baseline year. As per year end 2023, the sector alignment metric increased by 6 per cent to 3.8 kilograms of CO₂e per square meter. The 2030 target for the sector alignment metric is 2.5 kilograms of CO₂e per square meter (–30 per cent compared to 2020). The IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report does not include an emission intensity indicator comparable with the sector alignment metric (global metric not relevant for comparison with the Swedish household mortgage portfolio). No interim target has been set for 2025.

Table 74. ESG 3 – Banking book – Climate change transition risk: *Alignment metrics*

SEK m	a	b	c	d	e	f	g
30 Jun 2024		NACE Sectors (a minima)	Portfolio gross carrying amount	Alignment metric	Year of reference	Distance to IEA NZE2050 in %	Target (year of reference + 3 years)
1	Power	351,353	48,442	grams of CO ₂ e per kWh of power produced (Scope 1 & 2)	2022	–49%	N/A (see note 1)
2	Fossil fuel combustion	6,19	2,180	financed emissions (Scope 1 & 2 & 3 use of sold products)	N/A	N/A (see note 2)	N/A (see note 2)
3	Light vehicle manufacturing	29	4,412	grams of CO ₂ e per kilometer (Scope 3 use of sold products TtW)	N/A	N/A (see note 3)	N/A (see note 3)
4	Aviation	51	1,093	N/A	N/A	N/A (see note 4)	N/A (see note 4)
5	Maritime transport	50	50,244	grams CO ₂ e per tonne.nautical mile (Scope 1 & 3 fuel and energy)	N/A	N/A (see note 5)	N/A (see note 5)
6	Cement, clinker and lime production	23	2,317	N/A	N/A	N/A (see note 6)	N/A (see note 6)
7	Iron and steel, coke, and metal ore production	24	3,124	tonnes of CO ₂ e per tonne of steel (Scope 1 & 2)	2022	37%	N/A (see note 7)
8	Chemicals	20,22	16,645	N/A	N/A	N/A (see note 8)	N/A (see note 8)
9	Heavy vehicle manufacturing	30	4,180	share of ZEV in new sales (volumes)	N/A	N/A (see note 9)	N/A (see note 9)
10	Households	68	TBD	kilograms of CO ₂ e/square meter (Scope 1 & 2)	N/A	N/A (see note 10)	N/A (see note 10)

Notes

- The sector alignment metric was 124 grams of CO₂e per kWh of power produced in 2020, which is the baseline year. As per year end 2022, the sector alignment metric decreased by 24 per cent to 95 grams of CO₂e per kWh of power produced. The 2030 target for the sector alignment metric is 70 grams of CO₂e per kWh of power produced (–44 per cent compared to 2020). The distance to IEA NZE2050 has been calculated using the modelled 2030 CO₂ intensity of electricity generation published in the IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report (186 grams of CO₂e per kWh of electricity produced). No interim target has been set for 2025.
- The Fossil fuel combustion sector includes the extraction of oil and gas and refining of petroleum products sectors. The sector alignment metric was 18.7 million tonnes of CO₂e in 2020, which is the baseline year. As per year end 2022, the sector alignment metric decreased by 61 per cent to 7.3 million tonnes of CO₂e. The 2030 target for the sector alignment metric is 5.6 million tonnes of CO₂e (–70 per cent compared to 2020). According to the IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report, the emissions from combustion activities related to oil and natural gas decrease by 21 per cent in the NZE scenario between 2020 and 2030. No interim target has been set for 2025.
- The sector alignment metric was 159 grams of CO₂e per kilometer in 2020, which is the baseline year. As per year end 2022, the sector alignment metric decreased by 10 per cent to 143 grams of CO₂e per kilometer. The 2030 target for the sector alignment metric is 61 grams of CO₂e per kilometer (–62 per cent compared to 2020). The IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report does not include an emission intensity indicator directly comparable to the sector alignment metric. No interim target has been set for 2025.
- No 2030 sector target has been set for the Aviation sector.
- The Maritime sector includes the lending where vessels are used as collateral for our financing. The vessels in scope are the same as those included in the Poseidon Principles reporting. The sector alignment metric was 9.8 grams of CO₂e per tonne capacity transported per nautical mile sailed in 2022, which is the baseline year. The 2030 target for the sector alignment metric is 5.8 grams of CO₂e per tonne capacity transported per nautical mile sailed (–41 per cent compared to 2022). The IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report does not include an emission factor directly comparable to the sector alignment metric. No interim target has been set for 2025. The baseline year for the sector alignment metric is 2022.
- No 2030 sector target has been set for the Cement sector.
- The Iron and steel sector includes the manufacturing of carbon and stainless steel. The sector alignment metric was 1.39 tonne of CO₂e per tonne steel produced in 2020, which is the baseline year. As per year end 2022, the sector alignment metric increased by 6 per cent to 1.47 tonne of CO₂e per tonne steel produced. The 2030 target for the sector alignment metric is 0.98 tonne of CO₂e per tonne steel produced (–29 per cent compared to 2020). The distance to IEA NZE2050 has been calculated using the modelled 2030 CO₂ intensity of steel production published in the IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report (1.07 tonne of CO₂e per tonne steel produced). The IEA metric is not fully comparable to the sector alignment metric as it only includes industrial process emissions (Scope 1) while the sector alignment metric includes Scope 1 and 2 emissions. No interim target has been set for 2025.
- No 2030 sector target has been set for the Chemicals sector.
- The sector alignment metric was 0.5 per cent in 2022, which is the baseline year. The 2030 target for the sector alignment metric is 35 per cent. According to the IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report, the share of zero emission buses and heavy trucks in new sales reaches circa 35 per cent in 2030 in the NZE scenario. No interim target has been set for 2025. The baseline year for the sector alignment metric is 2022.
- The Household mortgage sector includes the lending related to the Swedish Household mortgage portfolio. The sector alignment metric was 3.2 kilograms of CO₂e per square meter in 2020, which is the baseline year. As per year end 2022, the sector alignment metric decreased by 2 per cent to 3.12 kilograms of CO₂e per square meter. The 2030 target for the sector alignment metric is 2.18 kilograms of CO₂e per square meter (–32 per cent compared to 2020). The IEA Net-Zero Roadmap – A Global Pathway to Keep the 1.5C Goal in Reach report does not include an emission intensity indicator directly comparable to the sector alignment metric. No interim target has been set for 2025.

COMMENT

- In the fourth quarter of 2024, the flood risk analysis was expanded to include commercial properties in Sweden, which had previously only accounted for household mortgages. This update means that all loans secured by residential and commercial properties in Sweden and the Baltics are now included in the flood risk assessment.

Definitions

Asset encumbrance An asset is considered encumbered if it has been pledged or if it is subject to any form of arrangement to secure, collateralise or credit enhance any transaction from which it cannot be freely withdrawn.

Average risk weight Total risk-weighted exposures divided by credit exposures post-CCF and post-CRM. Also referred to REA density or RWA density.

Back-testing A statistical technique used to monitor and assess the accuracy of a model, and how that model would have performed had it been applied in the past.

Capital conservation buffer Buffer under Basel III designed to ensure banks build up capital buffers outside periods of stress which can be drawn down as losses are incurred. Should capital levels fall within the capital conservation buffer range capital distributions will be constrained by the regulators.

Common Equity Tier 1 capital (CET1) Shareholders' equity excluding proposed dividend, deferred tax assets, intangible assets and certain other regulatory adjustments defined in EU Regulation no 575/2013 (CRR).

Common Equity Tier 1 capital ratio Common Equity Tier 1 capital as a percentage of risk exposure amount.

Countercyclical capital buffer Capital buffer financial institutions are required to hold in addition to other minimum capital requirements. Aims to achieve the broader macroprudential goal of protecting the banking sector from periods of excess aggregate credit growth that have often been associated with the buildup of system-wide risk.

Credit conversion factor (CCF) Factor used when calculating EAD for off-balance sheet items. CCF is an estimate of the proportion of undrawn commitments expected to have been drawn down at the point of default.

Credit risk mitigation (CRM) A range of techniques and strategies to actively mitigate credit risks to which the bank is exposed, e.g. collateral, netting and risk transfer.

Credit value adjustment (CVA) Capital charge to cover the risk of mark-to-market losses on the expected counterparty risk to OTC derivatives. CVA is the difference between the value of a derivative assuming the counterparty is default-risk free and the value reflecting default risk of the counterparty.

Debit valuation adjustment (DVA) The difference between the value of the derivative assuming the bank is default-risk free and the value reflecting default risk of the bank. Changes in a bank's own credit risk therefore result in changes in the DVA component of the valuation of the bank's derivatives.

Expected loss (EL) Amount expected to be lost on an exposure using a one year horizon. Calculated by multiplying PD, EAD and LGD.

Exposure at Default (EAD) Amount expected to be outstanding after any credit risk mitigation if the counterparty defaults.

External Credit Assessment Institutions (ECAI) External credit rating agencies such as Fitch, Moody's, DBRS and Standard & Poor's.

Green Asset Ratio (GAR) Key performance indicator for financial institutions, measuring the proportion of taxonomy-aligned on balance-sheet exposure in relation to the total covered assets.

Internal ratings-based approach (IRB) Method for determining own funds requirement using the banks' own models to estimate the risk. There are two versions of the IRB approach; with and without own estimates of LGD and CCF referred to as Advanced and Foundation, respectively.

IRB-Advanced A version of the IRB approach with own estimates of LGD and CCF.

IRB-Foundation A version of the IRB approach without own estimates of LGD and CCF.

Leverage ratio Tier 1 capital as a percentage of total assets including off-balance sheet items with conversion factors according to the standardised approach.

Loss given Default (LGD) The proportion of an exposure that the bank loses on average in the event of default.

Liquidity Coverage Ratio (LCR) High-quality liquid assets as a percentage of the estimated net cash outflows over the next 30 calendar days.

Minimum capital requirement Minimum amount of regulatory capital that the bank must hold to meet the Pillar 1 requirements.

Net Stable Funding Ratio (NSFR) Defined as the amount of available stable funding relative to the amount of required stable funding.

Own funds Comprises the sum of Tier 1 and Tier 2 capital.

Own funds requirement Total own funds must exceed 8 per cent of total risk exposure amount. Own funds must also cover additional requirements due to institution-specific buffers.

Pillar 1 The Basel framework is based on three pillars. Pillar 1 aligns minimum capital requirements more closely with institutions' actual risks.

Pillar 2 Provides for the supervisory review of institutions' internal assessments of their overall risks and capital adequacy.

Pillar 3 Motivates prudent management by enhancing the degree of transparency in institutions' public reporting.

Potential future exposure (PFE) Potential future credit exposure on derivative contracts calculated according to the mark-to-market approach.

Probability of Default (PD) The probability of a borrower defaulting within one year.

Risk exposure amount (REA) Total assets and off-balance sheet items, risk-weighted in accordance with capital adequacy regulations for credit risk and market risk. The operational risks are measured and added as risk exposure amount. Risk exposure amounts are only defined for the consolidated situation, excluding insurance entities and items deducted from own funds.

Standardised approach Method of calculating and reporting credit risks based on standardised risk weights on the basis of the external rating. The standardised approach can also be used for market risk and operational risk.

Stressed VaR Market risk measure based on potential market movements for a continuous one-year period of stress for a trading portfolio.

Systemic risk buffer Buffer requirement for systemically important banks.

Through-the-cycle (TTC) Methodology that seeks to take cyclical volatility out of the estimates of default risk by assessing the counterparty's performance over the business cycle.

Tier 1 capital Common Equity Tier 1 capital plus qualifying forms of subordinated loans liabilities, so called additional Tier 1 instruments.

Tier 1 capital ratio Tier 1 capital as a percentage of total risk exposure amount.

Tier 2 capital Mainly subordinated loans not qualifying as Tier 1 capital contribution.

Total capital ratio Total own funds as a percentage of total risk exposure amount.

Value at risk (VaR) A market risk measure of loss that could occur on positions as a result of adverse movements in market risk factors over a specified time period and to a given level of confidence.
